Table S5. Obtained t- and p-values from the liner-mixed model (*nlme* package) for the $\delta^{13}\text{C}$ values as well as for the C:N ratio in the mineral soil in relation to soil depth and different forest age. In bold is the significant change in the $\delta^{13}\text{C}$ values in the subsoil (30-45cm) of the different forest ages, as well as the change in the C:N ratio between 10 and 20cm (mentioned in the discussion) of the different forest ages.
