I believe your review on the paper is not complete as shown below.

"The manuscript is focused on an important issue about indicators choice of soil degradation in olive orchards. The idea, described in the title, is not described in depth in the other sections of the manuscript ( introduction, discussion) The manuscript shows important data on soil management in orchard in relation to specific site condition and weed biodiversity. Therefore, the manuscript could be accepted for the publication in SOIL after the major revision. Such major revision should mainly be addressed to
