Received and published: 21 July 2015

The revised version of the manuscript posted in July 14th has incorporated significant changes in order to address the major concerns issued by the reviewers, which can be summarized as:

1- The need for a better review of the topic, as well a more clear use of terminology along the manuscript.

Discussion Paper

2- An actual comparison of the accuracy and results obtained by both techniques.

3- Improved information about the badland processes occurring in the experimental area measured by TLS and SFM.

In my opinion, they have improved the MS in the line indicated by the reviewers. Since all the reviewers requires major modifications, and two of them (R1 and R2) agreed in reviewing the revised version of the manuscript, I will appreciate if they (R1 and R2) could post some brief comments indicating if they consider their comments addressed with the revised manuscript version uploaded on July 14th. If not, please specify with specific issue need to be re-revised.
