Predicting the spatial distribution of soil organic carbon stock in Swedish boreal forest using remotely sensed and site-specific variables

Kpade O. L. Hounkpatin[a1], Johan Stendahl[a], Mattias Lundblad[a] , Erik Karltun[a],

[a] Department of Soil and Environment, Swedish University of Agricultural Sciences, P.O. Box 7014, SE-75007, Uppsala, Sweden

Supplementary Information (SI)

[1] Correspondence : ozias.hounkpatin@slu.se

Figure SI 1: Prediction interval plot of the local and global random forest models for the humus layer, mineral soil and total SOC stock from the local and global Random

Figure SI 2: Correlation matrix of all variables with the humus layer SOC stock dataset over Sweden. Refer to table 1 for the definition of the abbreviation

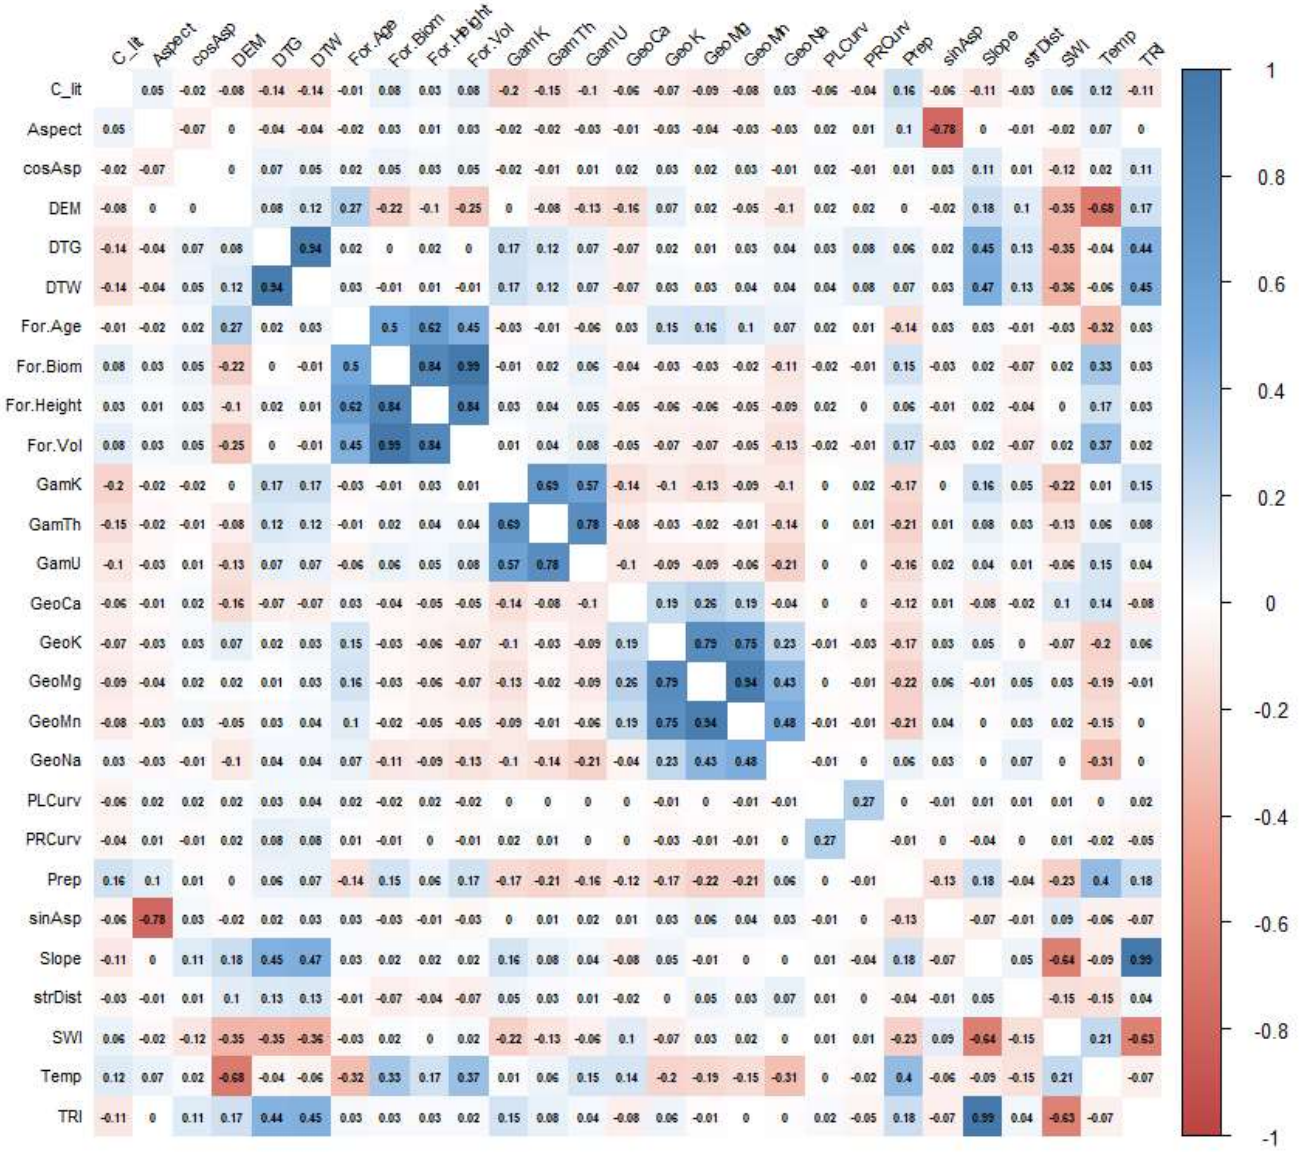

Figure SI 3: Correlation matrix of all variables with the mineral soil SOC stock dataset over Sweden. Refer to table 1 for the definition of the abbreviation

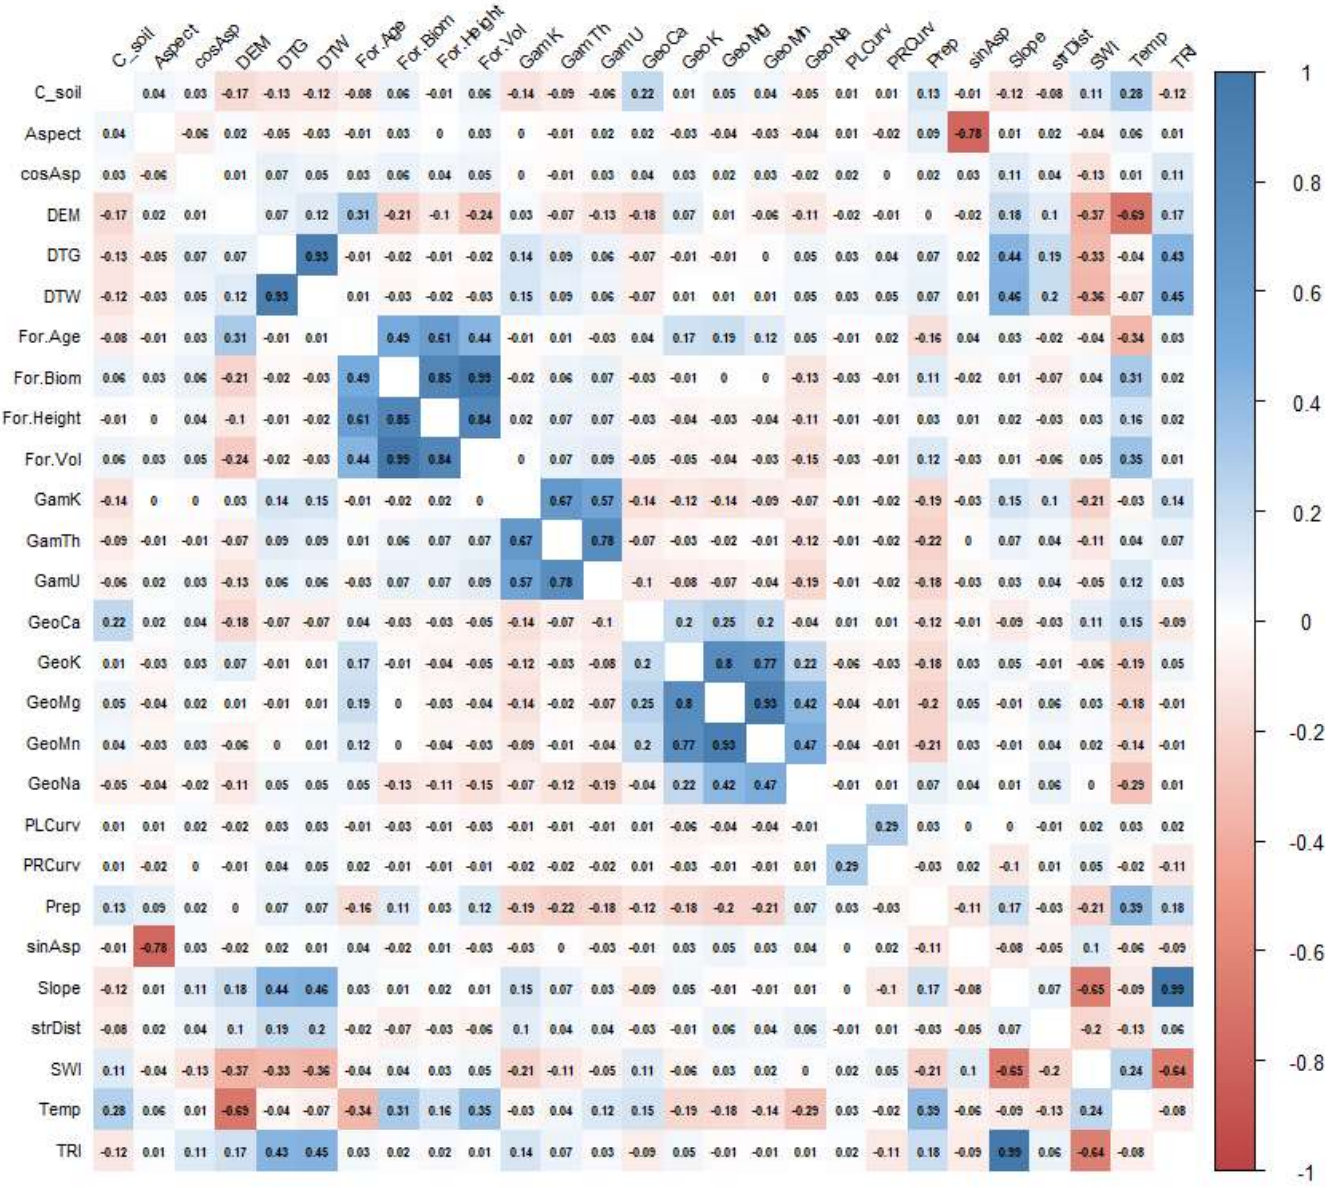

Figure SI 4: Correlation matrix of all variables with the total soil SOC stock dataset over Sweden. Refer to table 1 for the definition of the abbreviation

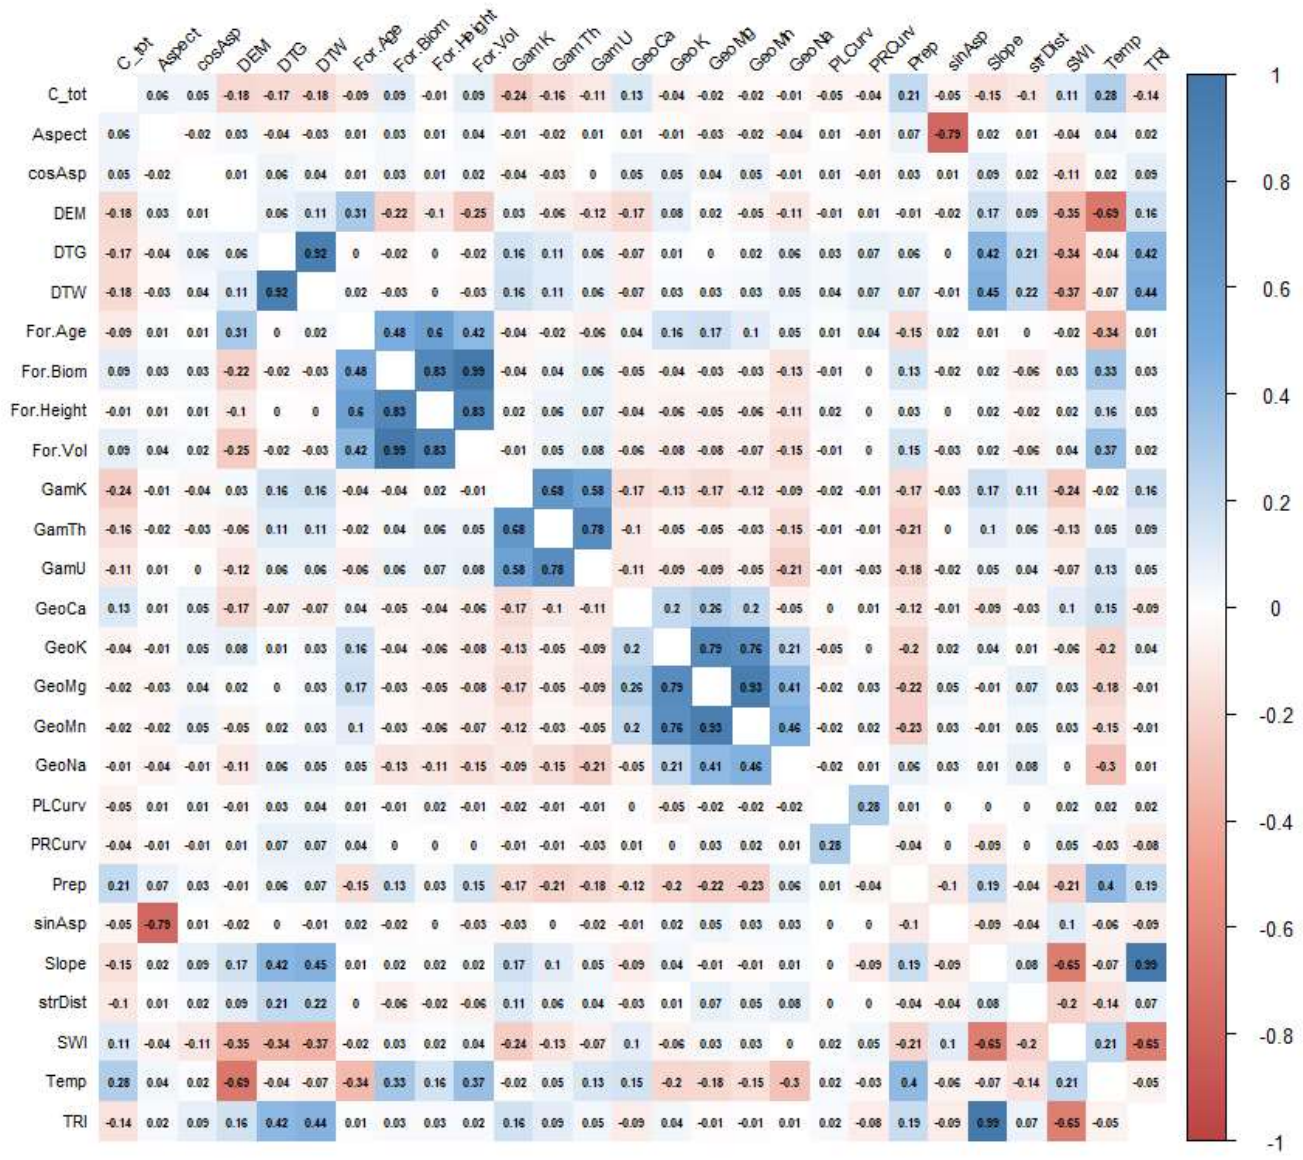

Figure SI 5: Variogram for the SOC stock and regression residuals of the local and global Random Forest models for the humus layer, mineral soil and total SOC stock. Log: log transformation, sqrt: square root transformation, Sph: spherical model, Ste: Matern, M. Stein's parameterization.

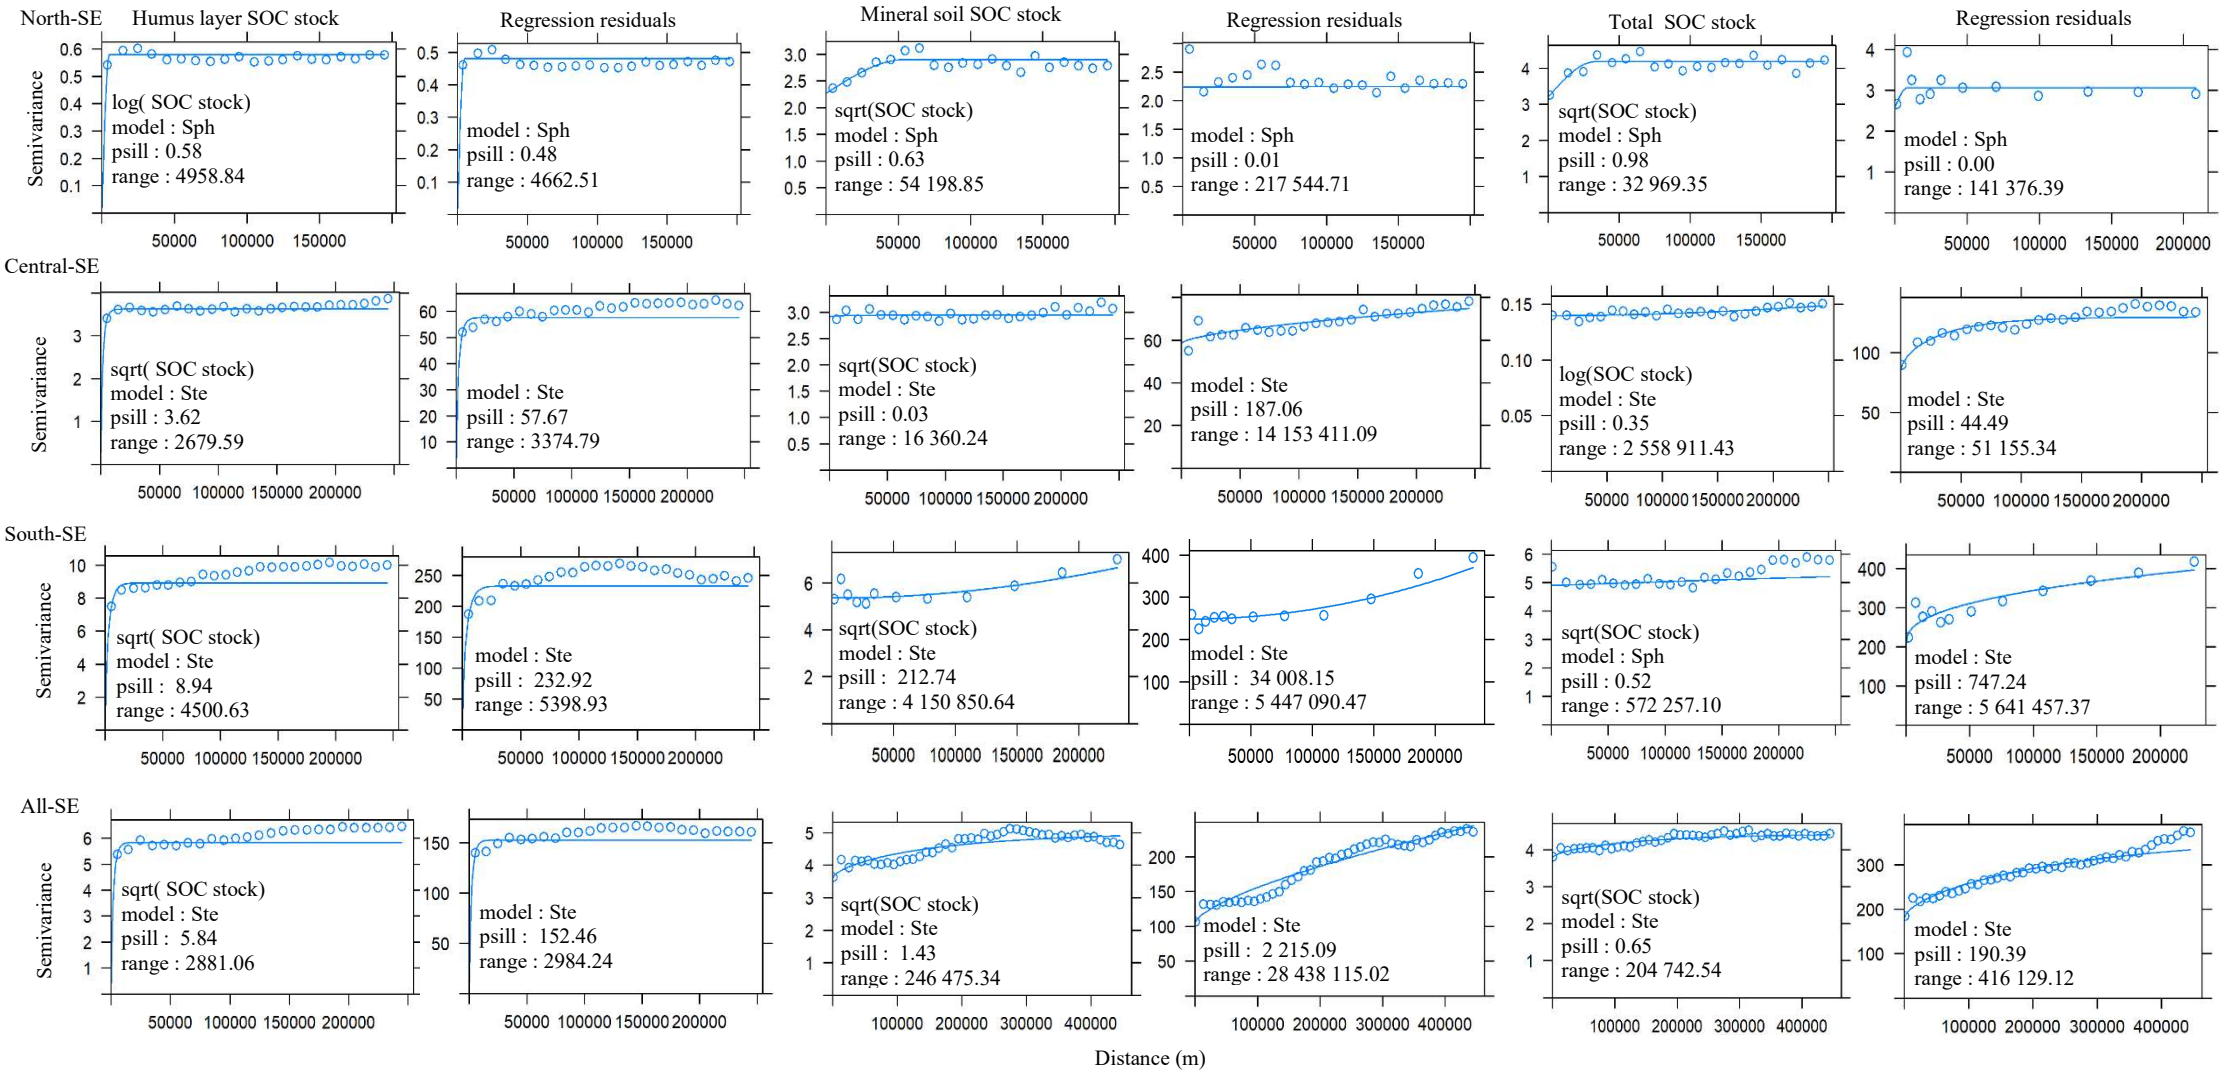

Figure SI 6: Box-plot for humus layer SOC stock by soil moisture, soil type, vegetation type, parent material and soil texture. Lines within the boxes give the median, red point within the boxes is the mean, boxes the 25th and 75th percentile (Refer to Table 2 for definition of the classes of each variable)

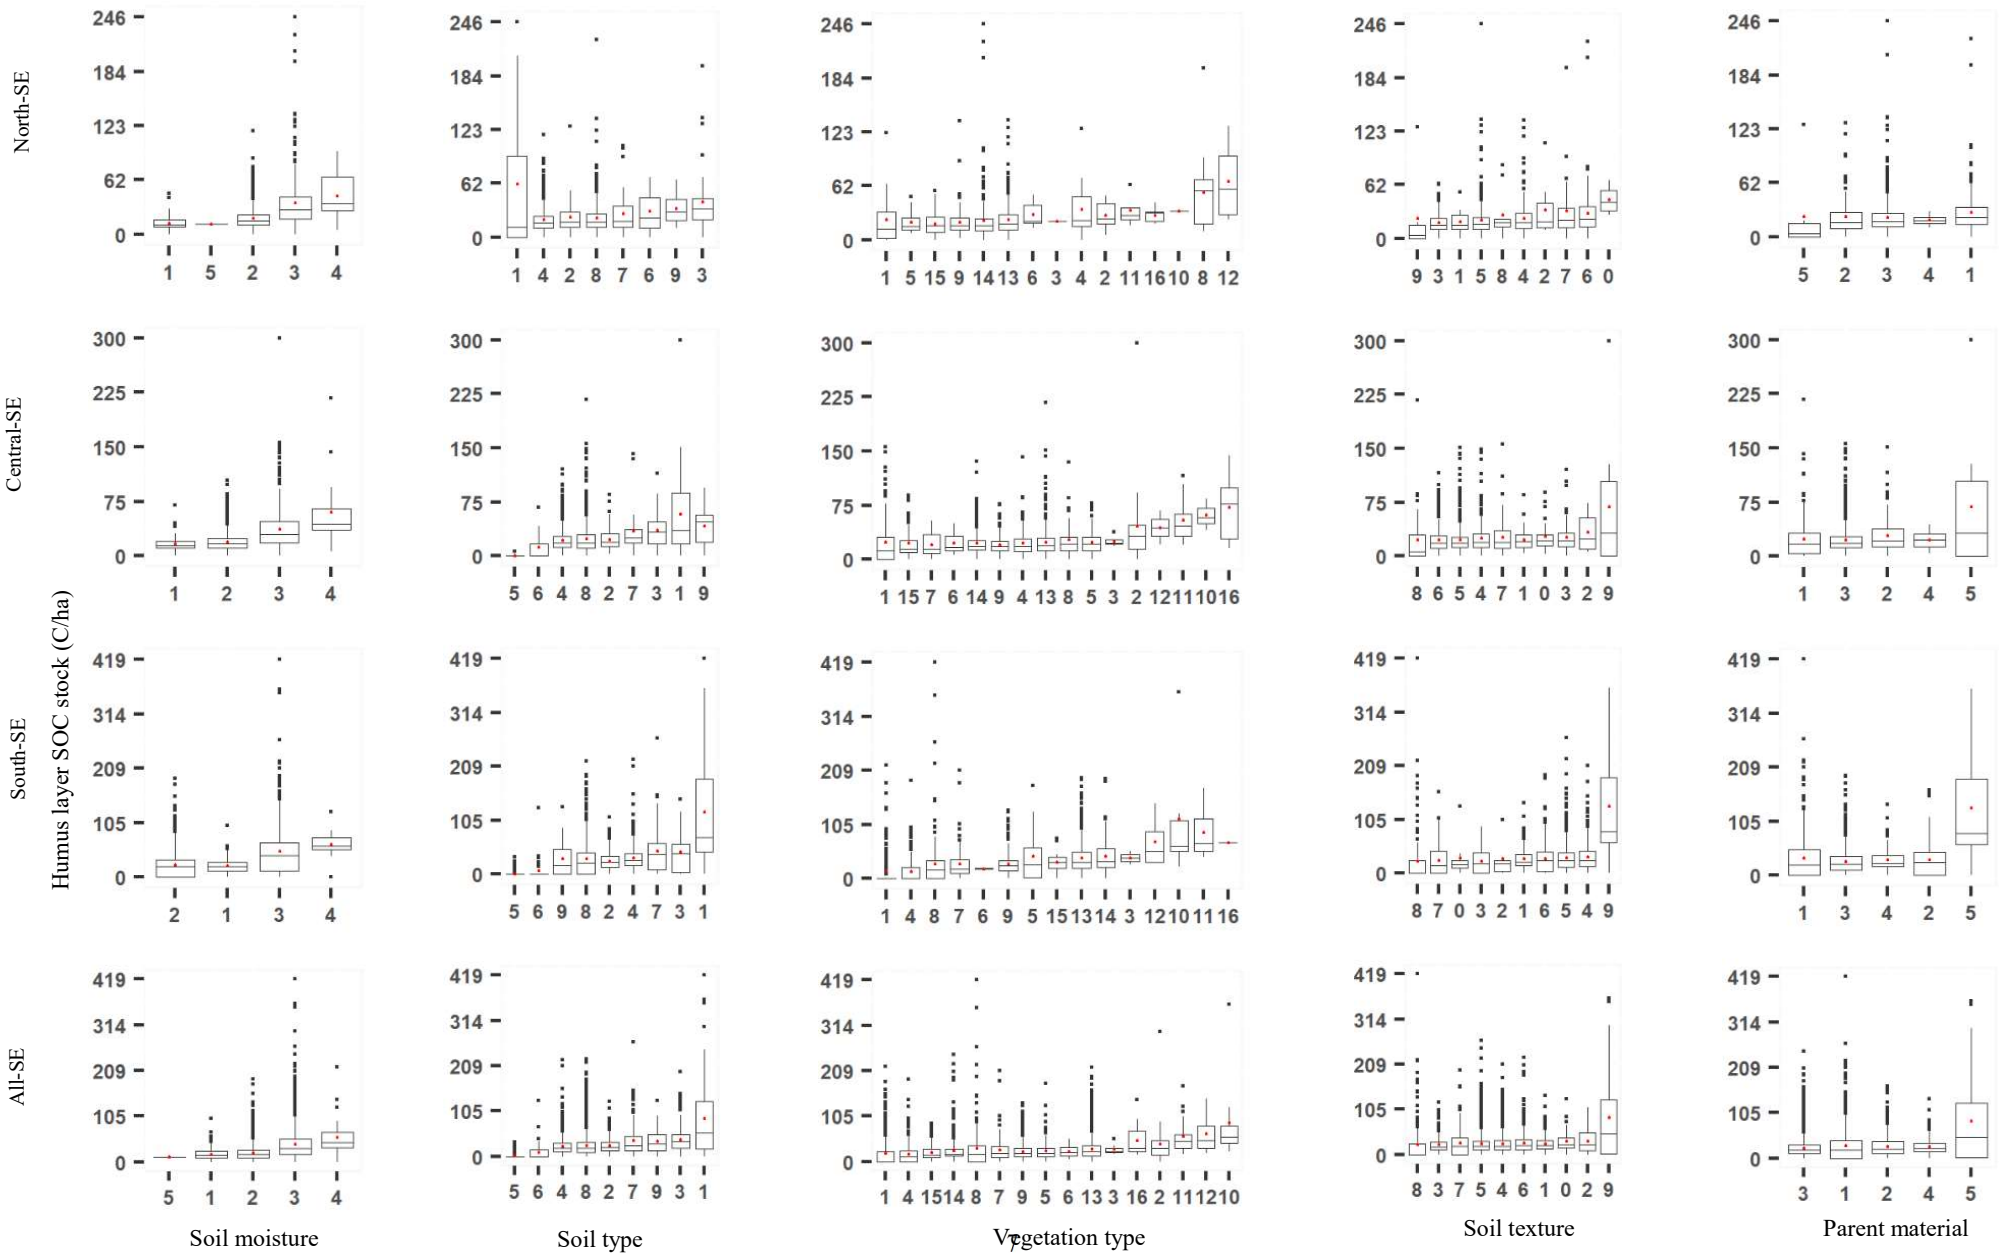

Figure SI 7: Box-plot for the mineral soil SOC stock by soil moisture, soil type, vegetation type, soil texture and parent material. Lines within the boxes give the median, red point within the boxes is the mean, boxes the 25th and 75th percentile (Refer to Table 2 for definition of the classes of each variable)

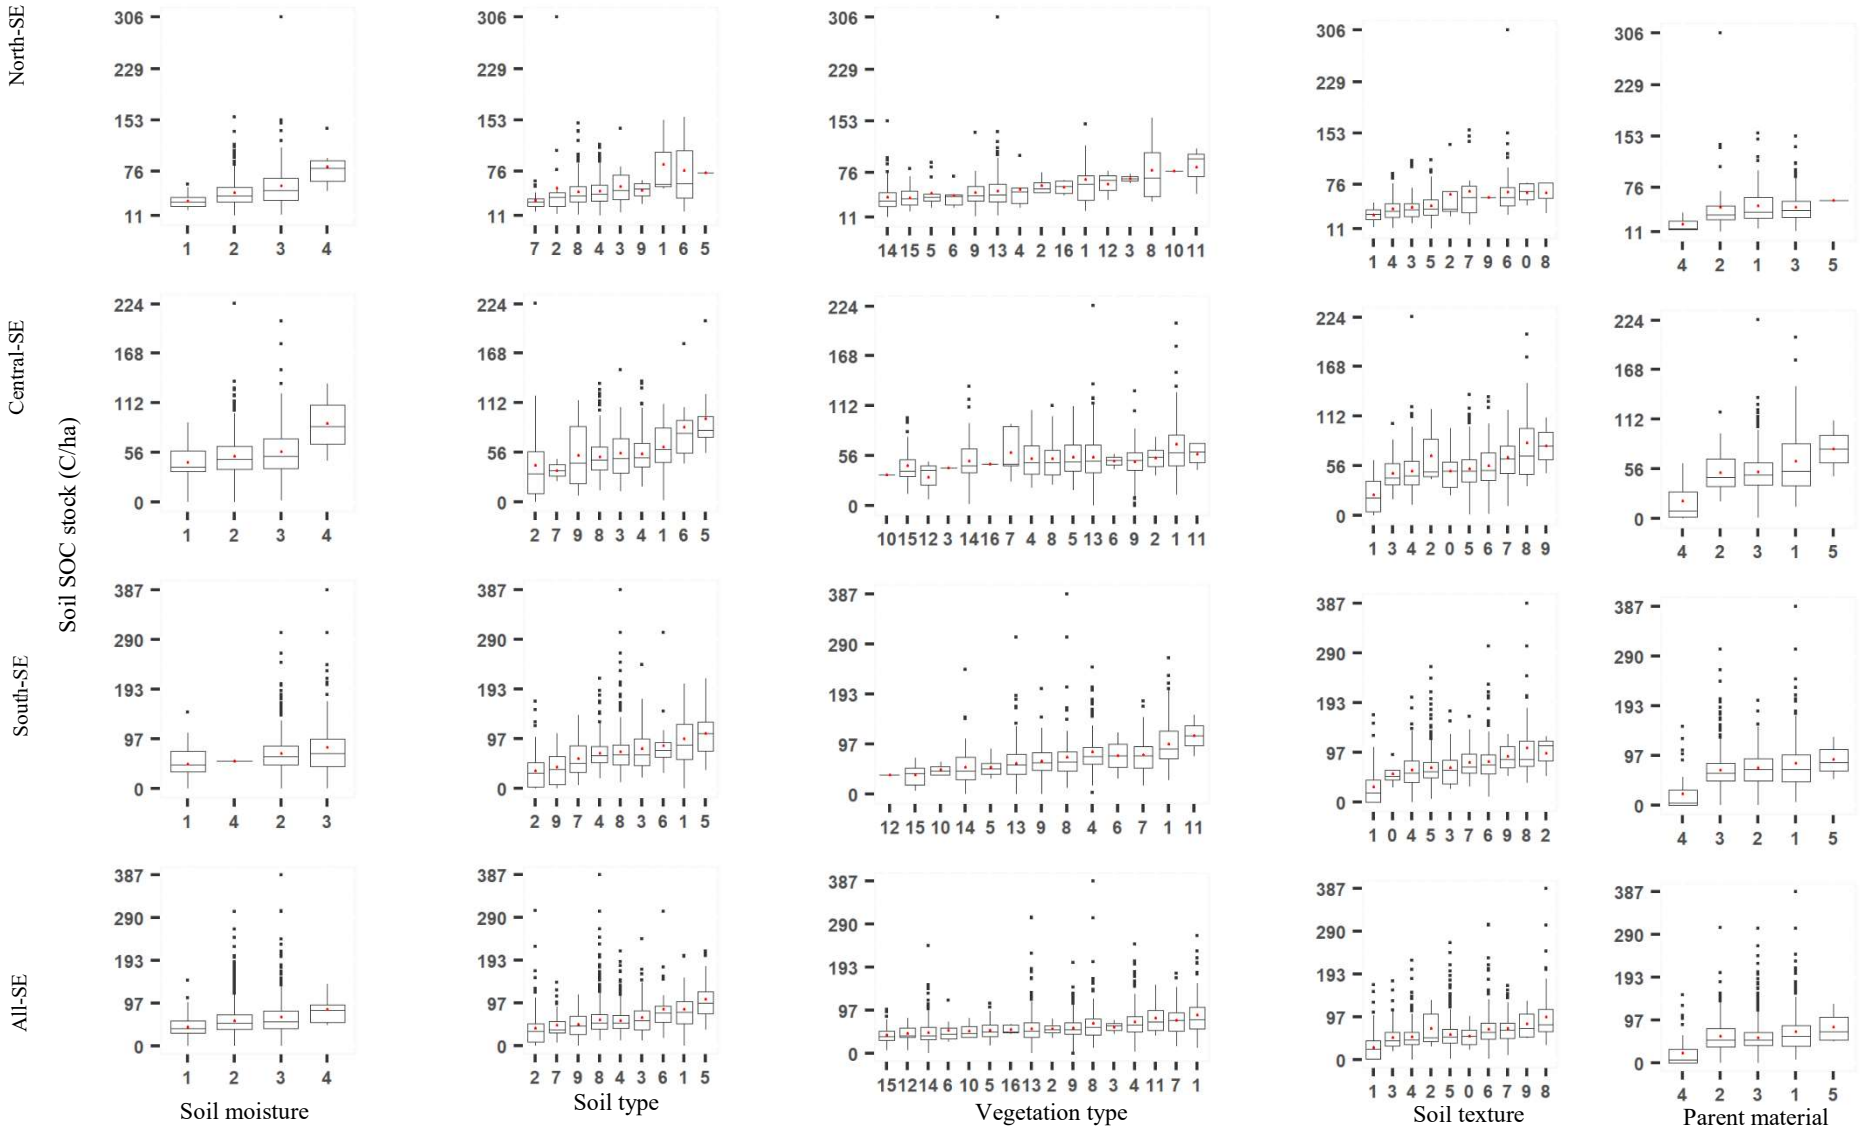

Figure SI 8: Box-plot for total SOC stock by soil moisture, soil type, vegetation type, soil texture and parent material. Lines within the boxes give the median, red point within the boxes is the mean, boxes the 25th and 75th percentile (Refer to Table 2 for definition of the classes of each variable)

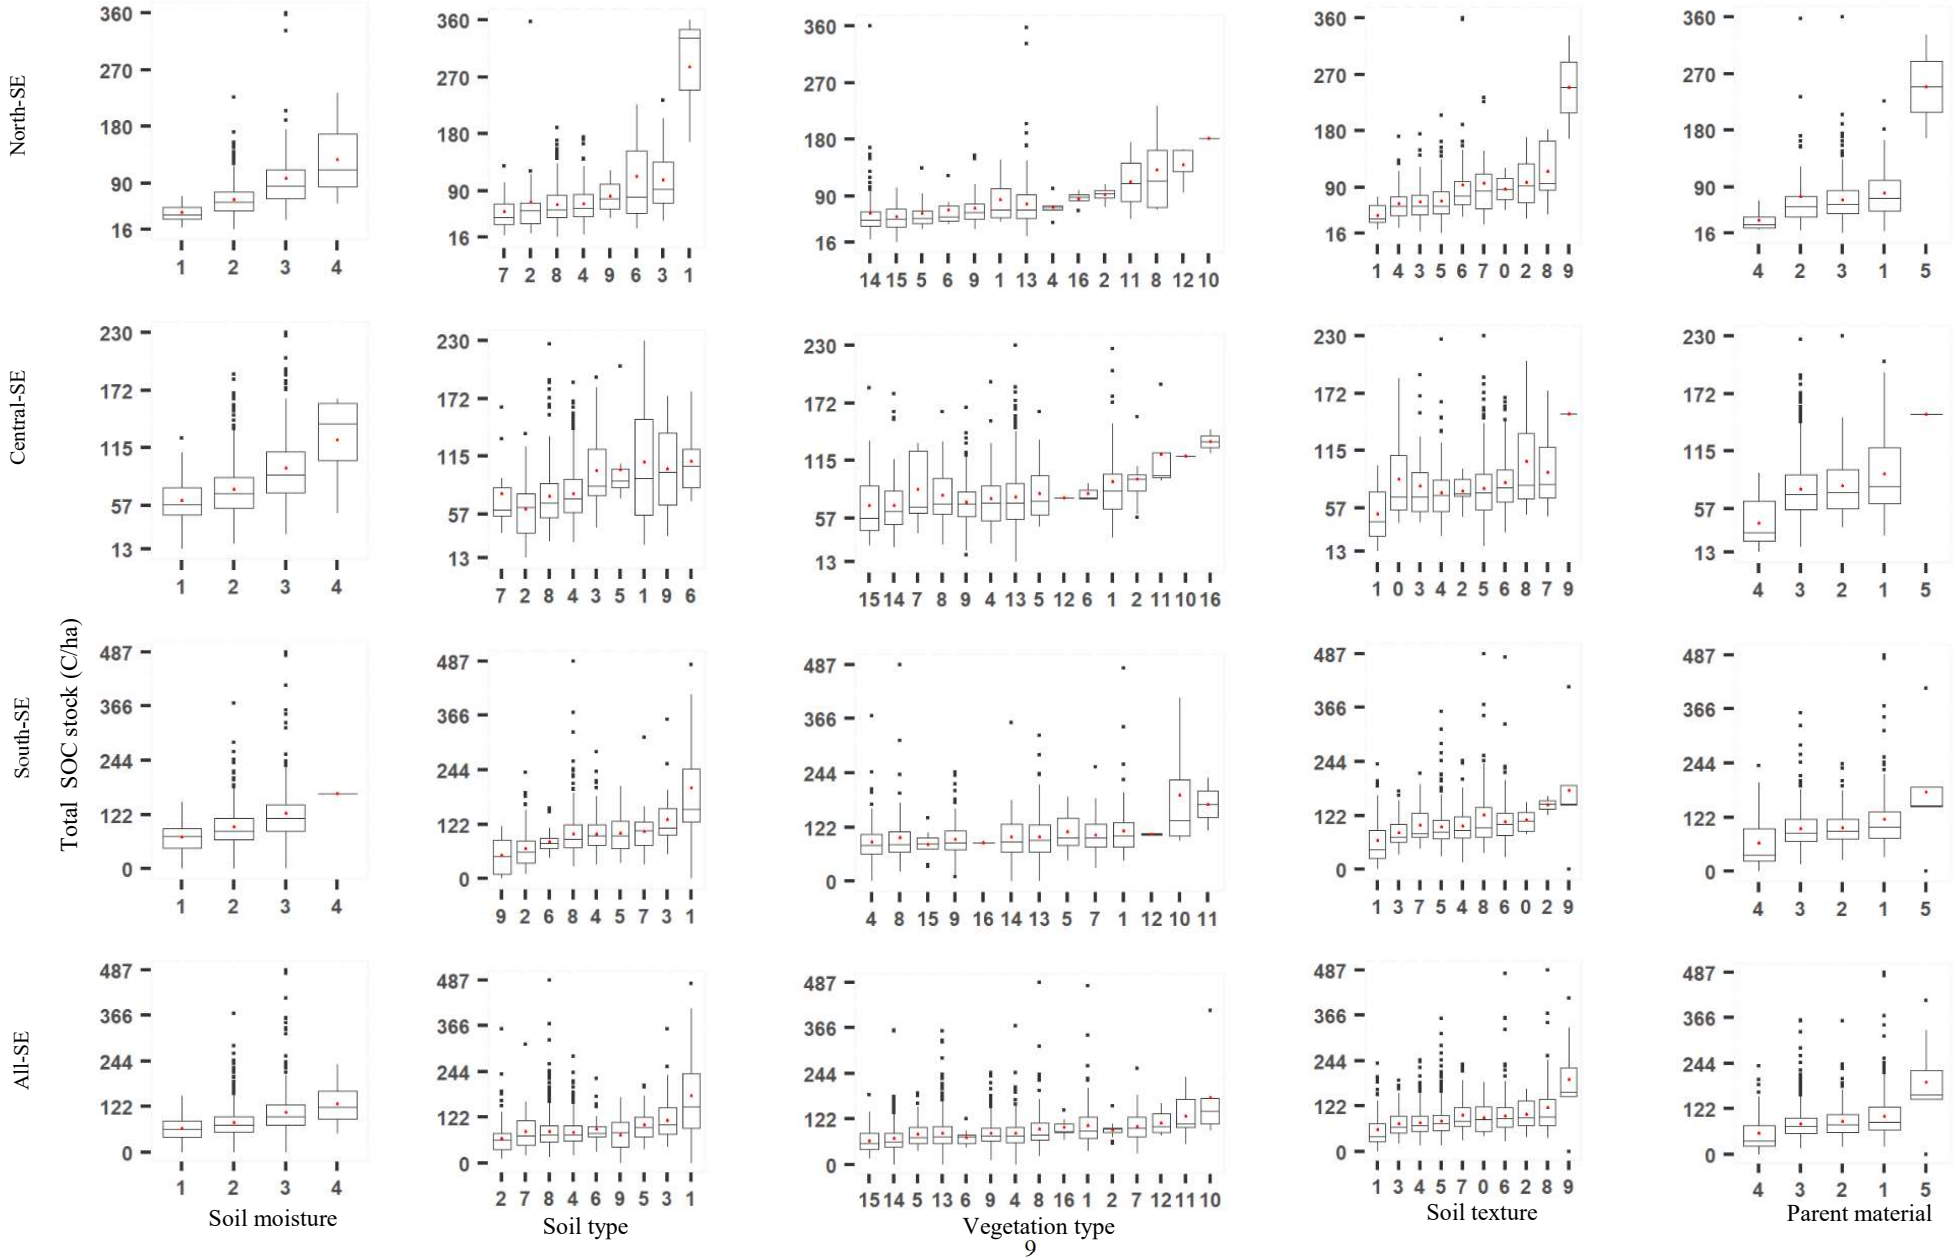

Figure SI 9: Partial dependence plots. Refer to Table 1 for the definition of the abbreviation and numbers for the classes of the variables.

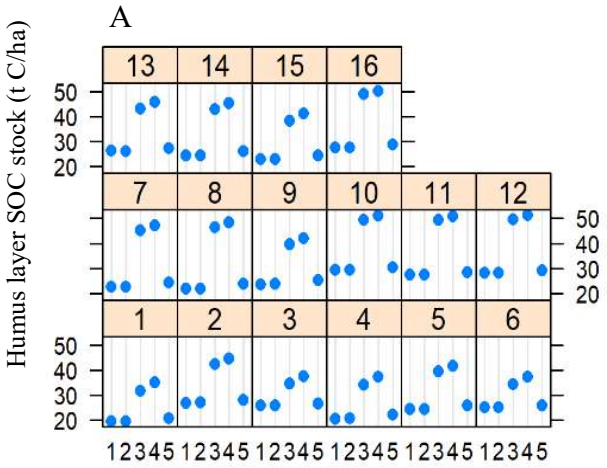
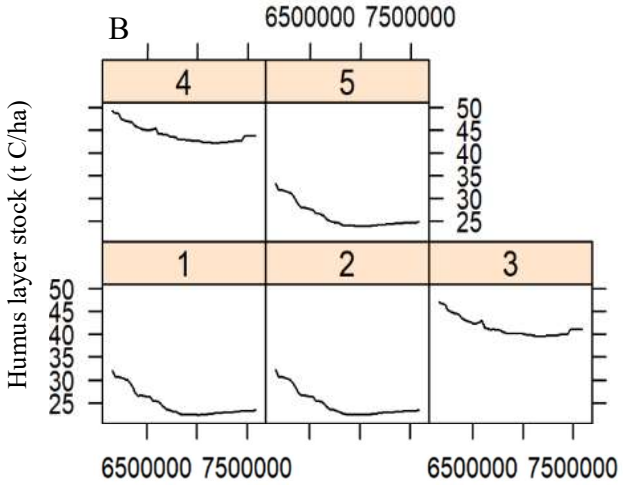
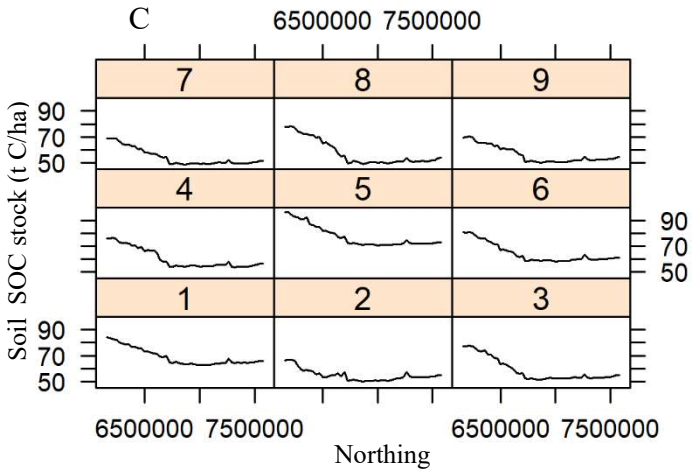


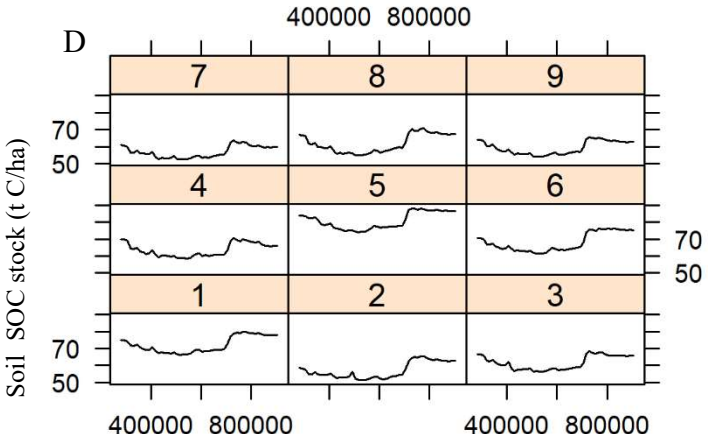
A: Partial plot between the humus layer SOC stock, soil moisture and vegetation type (RF Global model with all variables)



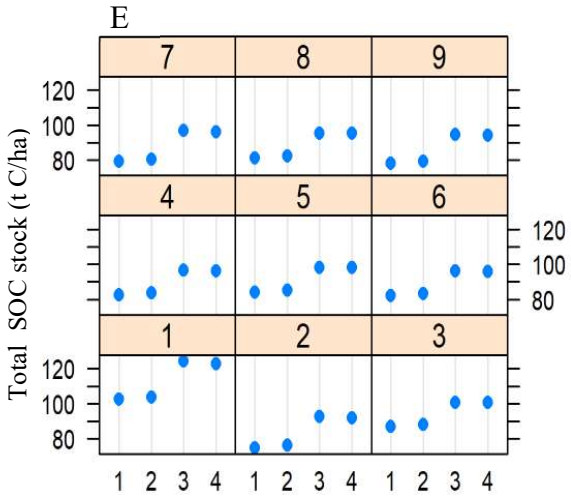
B: Partial plot between the humus layer SOC stock, soil moisture and Northing (RF Global model with all variables)



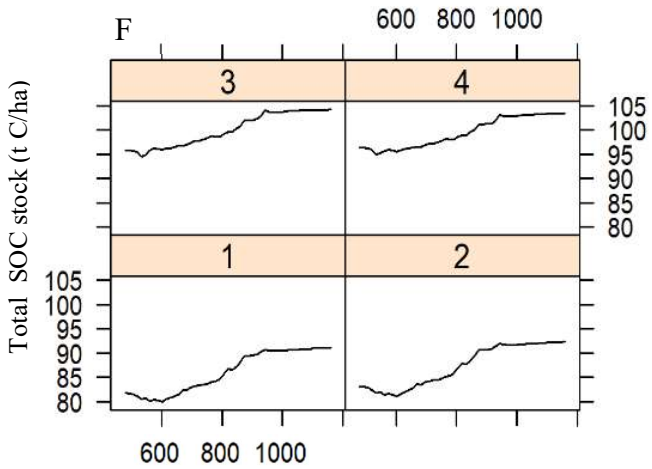
C: Partial plot between the mineral SOC stock, Northing and soil type (RF Global model with site specific variables)



D: Partial plot between the mineral SOC stock, Easting and soil type (RF Local model with site specific variables)

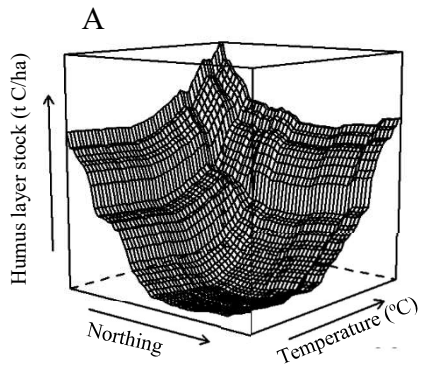


E: Partial plot between the total SOC stock, soil moisture and soil type (RF Global model all variables)

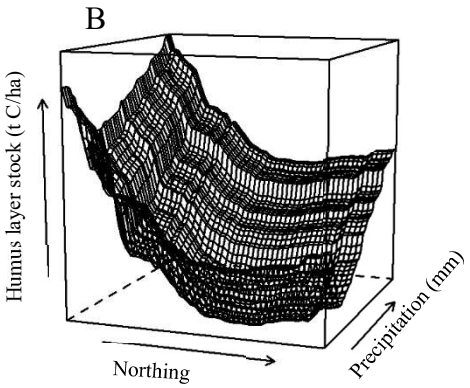


F: Partial plot between the total SOC stock, precipitation and soil moisture (RF Global model all variables)

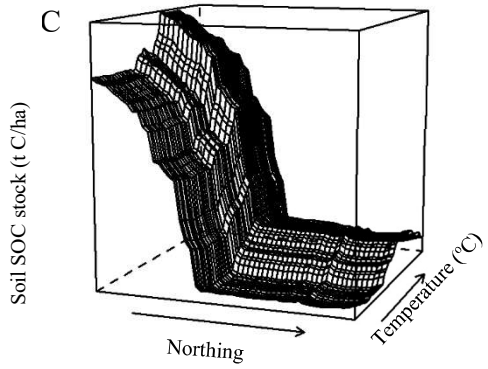
Figure SI 10: Partial dependence plots between SOC stock, northing, temperature and precipitation.



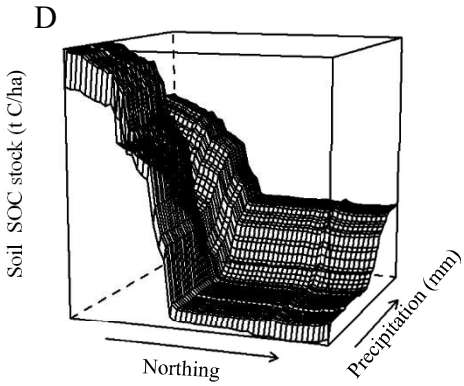
A: Partial plot between the humus layer SOC stock, Northing and Temperature (RF Global model with all variables)



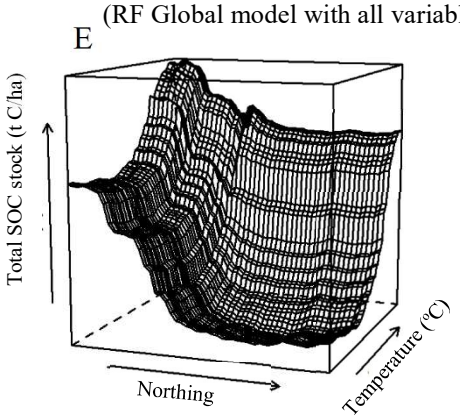
B: Partial plot between the humus layer SOC stock, Northing and precipitation (RF Global model with all variables)



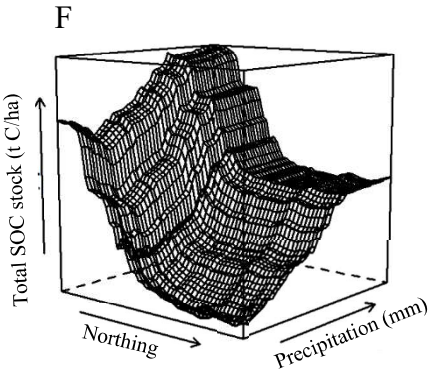
C: Partial plot between the mineral SOC stock, Northing and Temperature (RF Global model with all variables)



D: Partial plot between the mineral SOC stock, Northing and precipitation (RF Global model with all variables)



E: Partial plot between the total SOC stock, Northing and Temperature (RF Global model with all variables)



F: Partial plot between the total SOC stock, Northing and precipitation (RF Global model with all variables)

Asset SI 11: R code for SOC stock prediction

```
