5 S1 and S2: Soil temperature profiles from both study sites in Germany

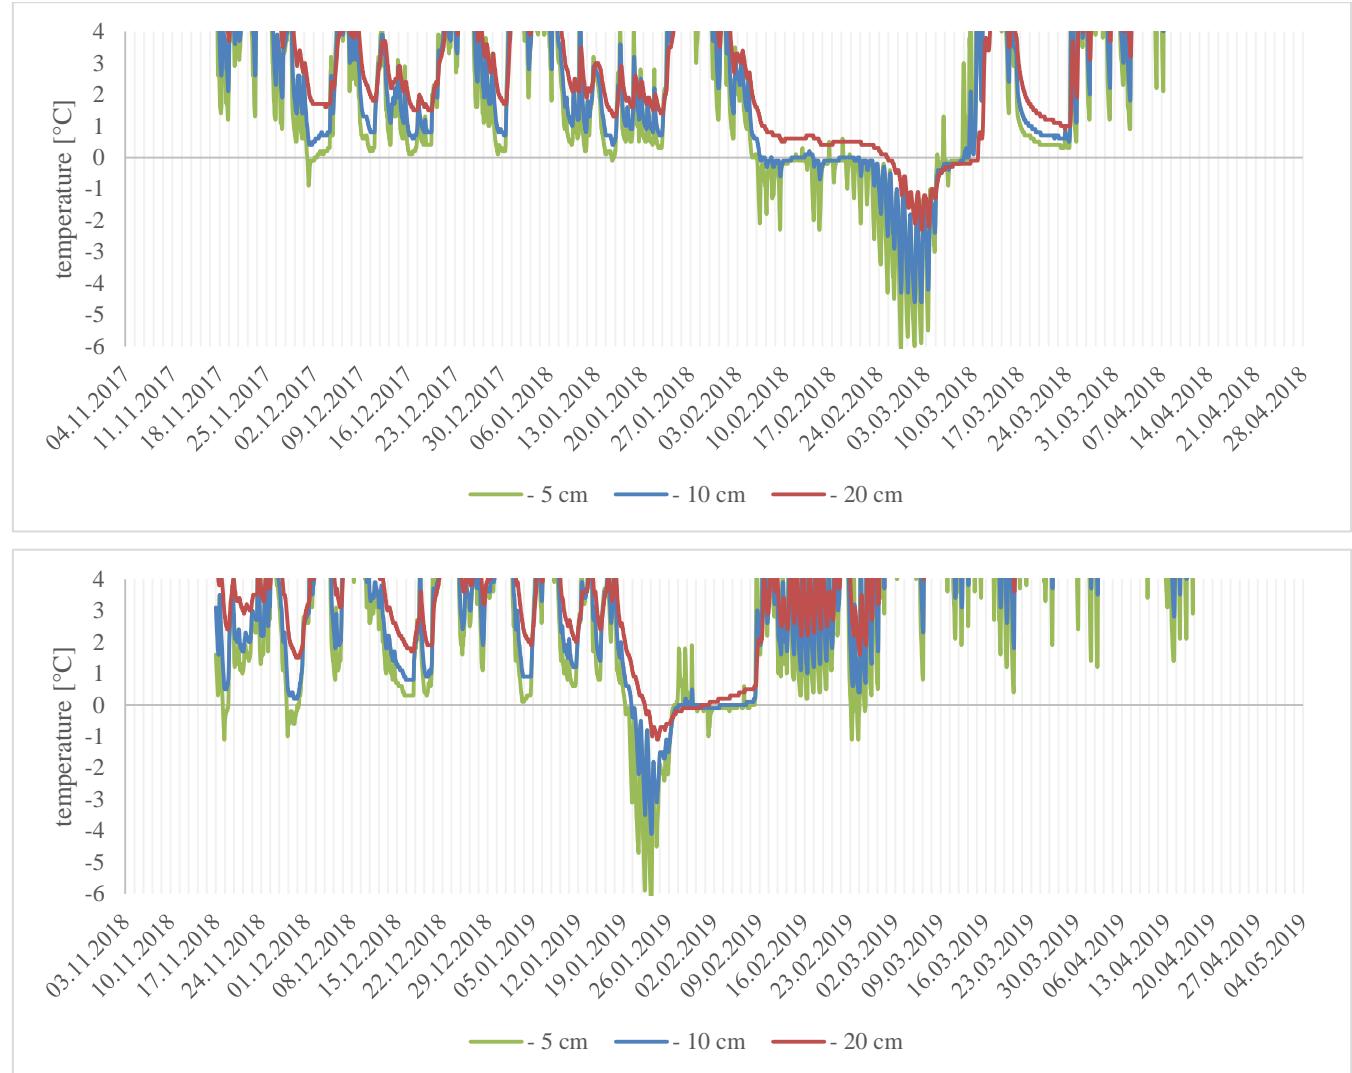

Figure S1: Hourly temperature profile from three different depths below the soil surface, Bad Lauchstädt/Germany, winter 2017/2018 (top) and winter 2018/2019 (bottom), silty loam

10 **Temperature in Giessen, Germany**

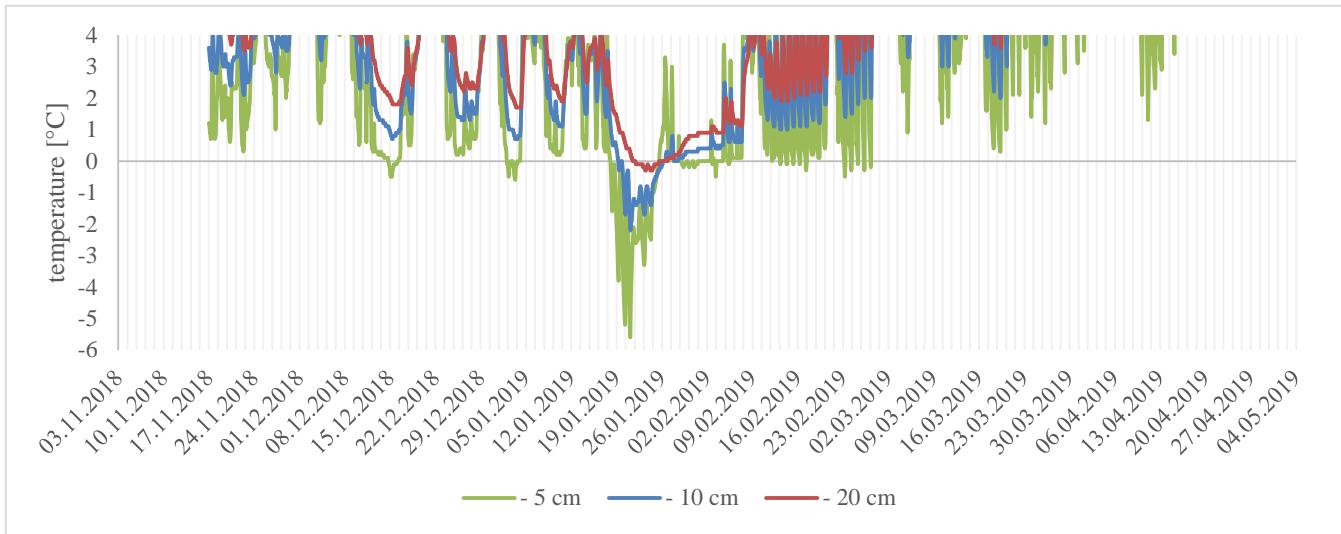

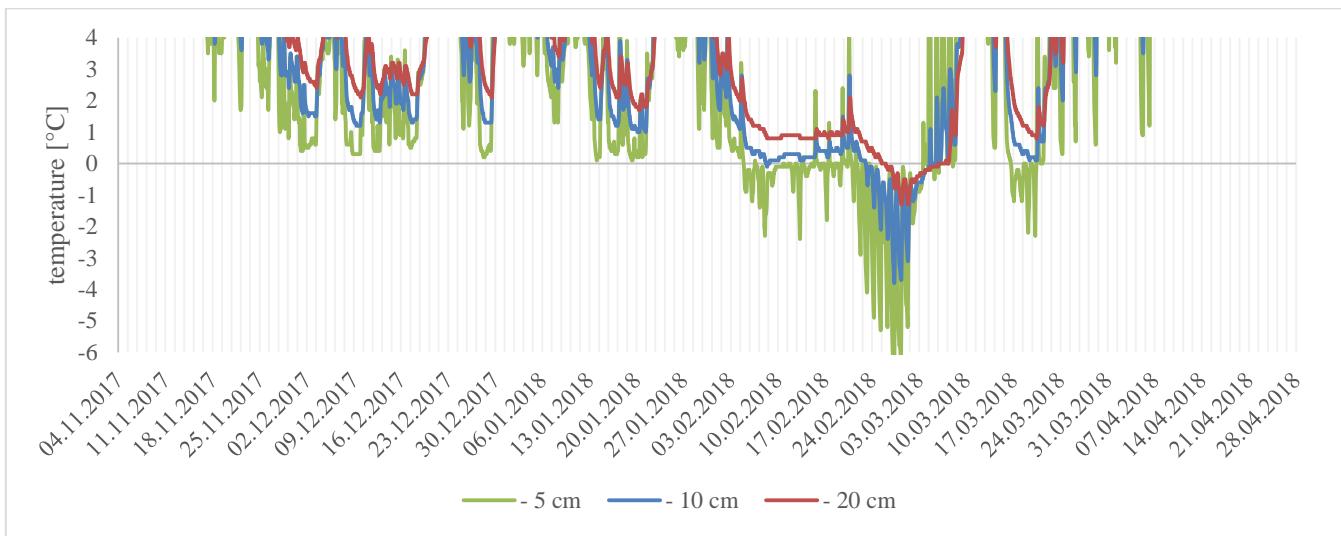

Figure S2: Hourly temperature profile from three different depths below the soil surface, Giessen/Germany, winter 2017/2018 (top) and winter 2018/2019 (bottom), silty clay

Hourly temperature information in soils at -5 cm, -10 cm and – 20 cm depth from both study sites were provided as open source data from the Deutscher Wetterdienst, a higher federal authority under the Federal Ministry of Transport and Digital Infrastructure (webpage: https://www.dwd.de/EN/climate_environment/cdc/cdc.html, last access January 21, 2021).

S3: X-ray μ CT section of an undisturbed loamy sand soil sample taken under grassland

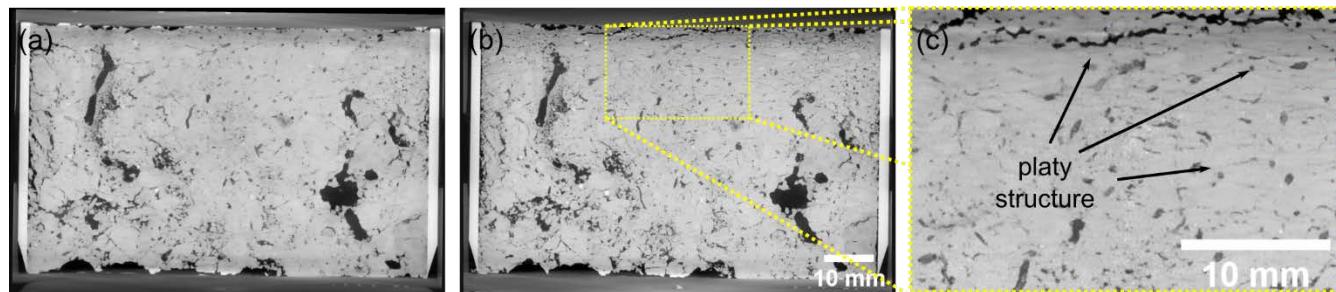

Figure S3: Vertical section of an undisturbed loamy sand sample after 0 (a) and 19 FTCs (b). The enlarged detail (c) shows the section close to the soil surface where a platy soil structure has been created by multiple FTC.
