16

17 **ABSTRACT**

18 Rain events in arid environments are highly unpredictable, interspersing extended periods of drought.
19 Therefore, tracking changes in desert soil bacterial communities during hydration-desiccation cycles in
20 the field, was seldom attempted. Here, we assessed rain-mediated dynamics of active community in
21 the Negev Desert biological soil crust (biocrust), and evaluated the changes in bacterial composition,
22 potential function, photosynthetic activity, and extracellular polysaccharide (EPS) production. We
23 predicted that increased biocrust moisture would resuscitate the phototrophs, while desiccation would
24 inhibit their activity. Our results show that hydration increased chlorophyll content, resuscitated the
25 biocrust *Cyanobacteria*, enhanced EPS production, and induced potential phototrophic functions.
26 However, decrease in the soil water content did not immediately decrease the phototrophs activity,
27 though chlorophyll levels decreased. Moreover, while the *Cyanobacteria* relative abundance
28 significantly increased, *Actinobacteria*, the former dominant taxa, significantly decreased in
29 abundance. We propose that, following a rain event, the response of the active bacterial community
30 lagged the soil moisture content due to the production of EPS which delayed the desiccation of the
31 biocrust community.

32

33 Key words: hydration; biocrust; bacteria; *Cyanobacteria*; *Actinobacteria*; EPS

34 1. INTRODUCTION

35 Arid environments are the largest terrestrial biomes on Earth and accounts for 35% of the landmass
36 (Pointing and Belnap, 2012). Rain in hot arid environments is rare and unpredictable, and the main
37 source of water is dew (Malek et al., 1999), or fog (Kidron et al., 2002). This moisture is readily
38 absorbed to the soil surface but would quickly evaporate due to high temperatures and low humidity
39 (Cameron and Blank, 1966). The long droughts in drylands limit plant growth and in their stead, the
40 soil is covered by microbial mats, named biological soil crust (biocrust). Biocrusts are a matrix of
41 phototroph and heterotroph microorganisms that are bind together with soil particles, by using
42 extracellular polymeric substances (Campbell et al., 1989; Belnap and Lange, 2001; Kidron et al.,
43 2020). The biocrust phototrophs are the main primary producers in this desolate habitat and together
44 with the heterotrophs, they form a rigid and stable mat that can resist to xerification and soil erosion
45 (Bowker et al., 2018; Aanderud et al., 2019).

46

47 Biocrusts are the main source of carbon and nitrogen (Agarwal et al., 2014), and a strong contributor
48 of soil respiration(Castillo-Monroy et al., 2011) in deserts. It was recently shown that, during long
49 droughts many of the biocrust microorganisms rely not only on photosynthesis but also on oxidation
50 of atmospheric trace gases(Meier et al., 2021; Leung et al., 2020). Once the biocrust is hydrated, the
51 phototrophs respond quickly by inducing their photosynthetic systems and related functions, to take
52 full advantage of the rare water abundance before the soil dehydrates (Murik et al., 2017). To that end,
53 photosynthetic members of the biocrust community form a seed bank of species that can spring to life
54 whenever the water content increases (Murik et al., 2017; Lennon and Jones, 2011; Kedem et al.,
55 2020). Yet, the abrupt hydration may also cause osmotic shock that could result in massive cell lysis
56 and the release of osmoregulatory solutes (Halverson et al., 2000; Harris, 1981). The period of water
57 abundance is usually brief, and the soil quickly dehydrates forcing the bacteria to cease their activity
58 (Murik et al., 2017; Oren et al., 2019). Therefore, the members of the biocrust community must
59 respond quickly and efficiently not only to hydration but also to the subsequent desiccation.

60

61 Earlier studies focused on community structure and cyanobacterial response to hydration-desiccation
62 cycles under controlled conditions (Angel and Conrad, 2013; Wu et al., 2013; Meier et al., 2020; Oren
63 et al., 2019). To the best of our knowledge, these cycles were never monitored in the field during a
64 rain event. Under natural conditions, the biocrust community dynamics of the hydration-desiccation
65 cycle may be affected by a plethora of variables, such as temperature, rain intensity, or soil local
66 structure, which could not be applied in laboratory settings. Thus, it is imperative to elucidate the
67 resuscitated community and its response to the gradual dehydration after a rain event in the field.

68

69 In this study, we followed the community structure and activity before, during, and after a rain event
70 in the arid Negev Desert highlands (Israel). We studied the active biocrust community by using SSU
71 ribosomes as a proxy to active bacterial community (Št'ovíček et al., 2017). Although ribosomes do
72 not quickly degrade in dormant or even dead cells (Sunyer-Figueres et al., 2018; Sukenik et al., 2012),
73 under field conditions they present a reliable mean to distinguish between active and inactive cells
74 (Št'ovíček et al., 2017; Angel et al., 2013; Baubin et al., 2019). We hypothesised that the biocrust
75 community would quickly respond to hydration and to desiccation. We predicted that high soil
76 moisture would trigger photosynthetic activity and carbohydrate production and a decreasing soil
77 moisture will lead to an inactivation of the phototrophs within the biocrust community. We further
78 predicted that heterotrophs response to hydration-desiccation would differ among phyla as previously
79 found for biocrust (Angel and Conrad, 2013) and topsoil (Št'ovíček et al., 2017) collected from the
80 same site. Specifically, we predicted a sharp decrease in the relative abundance of Actinobacteria
81 phylum that dominates the soil during droughts but declines upon hydration (Št'ovíček et al., 2017;
82 Angel et al., 2013; Blazewicz et al., 2013).

83 **2. MATERIAL AND METHODS**

84 **2.1. Sampling**

85 The study was conducted in the long-term ecological research station in the Negev Desert Highlands
86 (Zin Plateau, 30°86'N, 34°80'E, Israel; Figure 1). In this arid environment, the average annual rainfall
87 is around 90 mm and extends from October to April. Biocrust samples were collected on 20/06/17
88 during the dry season (T[0]; average temperature: 32.4°C) and during a rain event in the wet season
89 from 29/01/18 through 01/02/18 at 24 hr intervals. The rain event (5.1 mm, maximum average
90 temperature 14.6 °C) occurred 29/01/18 (T[R]) and samples were collected till the biocrust dried
91 (T[1], T[2], T[3]; Figure 1) For each time point, five samples (each ~200 g) at least 10 m apart were
92 collected (N = 25 samples). The biocrust samples were homogenised using a 2 mm sieve and then four
93 subsamples were stored: (1) at -80°C for molecular analysis; (2) at -20°C for chlorophyll extraction;
94 (3) at 60°C for 3 days and then kept at room temperature for chemical analysis; and (4) was used
95 immediately to evaluate the water content.

96

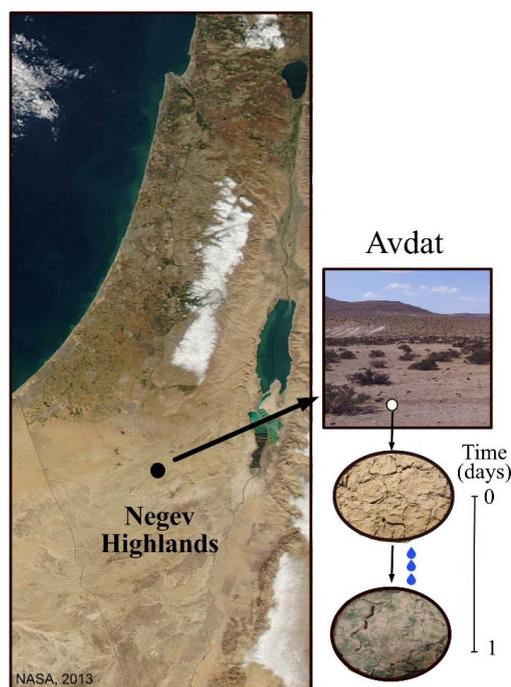

Figure 1. Location of the sampling site (Avdat) in the Negev Highlands (Israel) with close-ups of the crust at time 0 (before hydration) and at time 1 (after hydration). The crust becomes greener after a rain event.

110

111 **2.2. Physico-chemical analyses**

112 Water content, organic carbon and total nitrogen were measured in the soil samples. Biocrust water
113 content was determined by the gravimetric method, the soil was weighed before and after oven drying
114 at 105°C, then the percentage of moisture in the soil was determined (Scrimgeour, 2008). Organic
115 carbon content was determined using the loss-on-ignition method. 30 g of the dry soil sample was
116 burnt at 380°C for 6 hours, and the fraction of organic carbon content was calculated as previously
117 described (Scrimgeour, 2008; Hoogsteen et al., 2015). Total nitrogen was measured in 50 mg of soil
118 using the FlashSmart CHNS/O elemental analyser (ThermoFischer, Waltham, MA, USA). The
119 standards: BBOT (2,5-Bis (5-tert-butyl-benzoxazol-2-yl) thiophene), Tocopherol Nicotinate and a soil
120 reference material were used to calibrate the instrument.

121 **2.3. Chlorophyll concentration and water content**

122 The chlorophyll of each sample was extracted using a protocol based on Ritchie (2006) and Castle et
123 al. (2010). The extraction was done using methanol, with a soil: methanol ratio of 3:9, followed by a
124 15-minutes incubation at 65°C and a 2-hour incubation at 4°C. The samples were centrifuged, and the
125 supernatant was measured by spectrophotometry (Infinite 200 Pro, Tecan, Switzerland) at 665 nm and
126 the concentration of chlorophyll was calculated following (Ritchie, 2006). Dried *Spirulina* cultures
127 were used as positive control at 0.003g per g of soil. Distilled water (DW) was used as negative
128 controls. The concentrations are presented in mg chlorophyll per g of soil (mg chl_a/g soil).

129 **2.4. Carbohydrate extraction and Polysaccharide content**

130 Extracellular polysaccharides (EPS), and more precisely the tightly-bound carbohydrates that are
131 attached to the soil particles, were extracted using a 100 mM EDTA solution for 16 hours. About 20
132 mL of EPS were extracted from 2.5 g of soil and were kept at -20°C until further processing. The
133 polysaccharide content was measured using a phenol-sulfuric acid assay with a glucose standard
134 curve, as previously described (Dubois et al., 1956). Briefly, each EPS fraction was combined with
135 equal volume of 5% w/v phenol and 2.5 folds sulfuric acid. The mixture was vortexed, incubated

136 (45 min at room temperature) and absorbance measured at 490 nm (Infinite 200 Pro, Tecan,
137 Switzerland).

138 **2.5. RNA extraction and preparation for sequencing**

139 RNA was extracted from 0.5 – 1 g of soil using phenol-chloroform, following a previously described
140 protocol (Angel, 2012). The extracted total nucleic acids were treated with DNase (Takara, Shiga,
141 Japan) to remove the DNA. The remaining RNA was cleaned using the *MagListo* RNA Extraction kit
142 (Bioneer, Daejeon, South Korea). The RNA was reverse transcribed to cDNA using Superscript IV
143 (ThermoFischer, Waltham, MA, USA), and purified using the PCR purification kit (Bioneer, Daejeon,
144 South Korea) in accordance with the manufacturers' instructions. The cDNA was used as a template to
145 amplify the V3-V4 regions of the 16S rRNA using 341F and 806R primers (Table A1), in triplicates.
146 Library preparations and sequencing were performed at the Research Resource Centre at the
147 University of Illinois with pair end (2 × 300 bp) MiSeq platform (Illumina, San Diego, CA, USA).
148 Due to low concentrations of ribosomes in the dry soil collected during the summer of 2017, we had to
149 re-extract and re-sequence these samples. However, COVID-19 restrictions prohibit us from using the
150 same sequencing platform, and we were forced to use the facilities and resources available to us at the
151 time. Therefore, RNA was extracted using the RNeasy PowerSoil Total RNA Kit (Qiagen, Hilden,
152 Germany), following the manufacturer's protocol. Then, the V3-V4 regions of the 16S rRNA were
153 amplified using 341F and 515R primers (Table A1), in triplicates. The samples were sequenced (2 ×
154 150 bp) on the iSeq platform (Illumina, San Diego, CA, USA) at the Central and Northern Arava R&D
155 Centre (Israel).

156 **2.6. Community analysis**

157 Reads were merged, quality checked, and trimmed following the NeatSeq-Flow pipeline (Sklarz et al.,
158 2018). The sequences were analysed using QIIME2 (Bolyen et al., 2018) and Dada2 (Callahan et al.,
159 2016). Reads were clustered in amplicon sequence variants (ASVs) and taxonomy was assigned using
160 Silva v138 (Quast et al., 2013). The total number of sequences can be found in Table A2. All raw
161 sequences used in this study can be found in BioProject (<https://www.ncbi.nlm.nih.gov/bioproject>)
162 under the submission number PRJNA718159.

163 **2.7. Functional predictions**

164 Functional predictions of the 16S amplicons were done using Piphillin (Narayan et al., 2020; Iwai et
165 al., 2016) and the KEGG database with a 97%-identity cut-off (May 2020) (Kaneshisa and Goto,
166 2000). Steps of metabolic pathways for different methods of harvesting energy (organotrophy,
167 lithotrophy and phototrophy) (Cordero et al., 2019; Greening et al., 2016; León-Sobrino et al., 2019;
168 Tveit et al., 2019), for parts of the nitrogen cycle (Galloway et al., 2004), and for the survival of the
169 individual during a drought (DNA conservation and repair, sporulation and Reactive Oxygen Species
170 (ROS)-damage prevention) (Borisov et al., 2013; Hansen et al., 2007; Henrikus et al., 2018; Preiss,
171 1984; Preiss and Sivak, 1999; Rajeev et al., 2013; Repar et al., 2012; Slade and Radman, 2011) were
172 selected. Then, we picked out genes of interest from each step in the KEGG database and built our
173 own database (Table A3). The assignment of function to the KEGG numbers of the abundance table
174 from Piphillin was done in R using phyloseq (McMurdie et al., 2017). The significance of temporal
175 differences in predicted functionalities was evaluated using a non-parametric test (Kruskal-Wallis test
176 and a post-hoc Dunn test (Dinno, 2017; Dunn, 1964; Kruskal and Wallis, 1952).

177 **2.8. Statistical analysis**

178 All statistical analysis was done using R (R: A language and environment for statistical computing)
179 using the phyloseq (McMurdie et al., 2017) along with the ggplot2 (Wickham, 2016), vegan (Oksanen
180 et al., 2014), magritt (Wickham and Bache, 2014), dplyr (Wickham et al., 2018), scales (Wickham,
181 2017), grid (Murrell, 2004) packages. The significance of difference between time points was
182 determined using a non-parametric test: Kruskal-Wallis test and Dunn test (Dinno, 2017; Dunn, 1964;
183 Kruskal and Wallis, 1952).

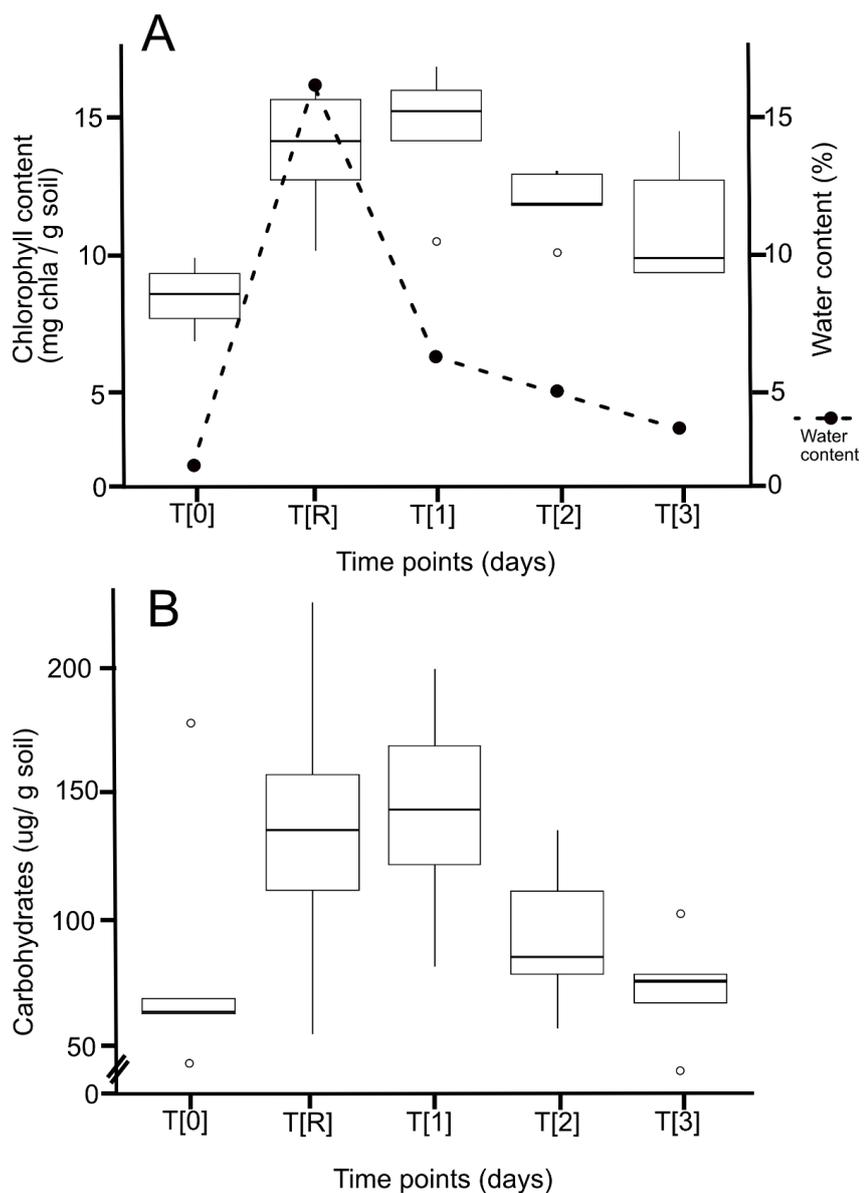

184

185 **3. RESULTS**

186 **3.1. Temporal changes in the biocrust chlorophyll, carbohydrates, and chemical analyses**

187 We have followed changes in the biocrust before, during and after a rain event and noted that a day
188 after the rain (T[1]) the biocrust in the sampling site was visibly greener than at any other sampling
189 point (Figure 1). The average chlorophyll concentrations along with the soil water content in the
190 biocrust at each sampling point were monitored (Figure 2A, Table A4). The biocrust water content
191 was lower at the dry season T[0] and significantly increased during the rain event T[R] (2.26% and
192 16.2%, respectively, $p = 0.05$; Table A5). Then soil moisture significantly decreased to 3.67% at T[3]
193 ($p < 0.05$). The chlorophyll concentrations significantly increased right after the rain event (from 8.45
194 mg chl_a/g soil to 14.57 mg chl_a/g soil, during the rain event, $p = 0.0002$; Table A4 and A5), but
195 decreased significantly in later days (from 14.57 mg chl_a/g to 11.17 mg chl_a/g soil, three days after the
196 rain, $p > 0.02$; Table A4 and A5). However, the carbohydrate concentration significantly increases
197 after the rain event (from 83 μg/g soil to 143 μg/g soil, $p < 0.05$, Table A4 and A5, Figure 2B). After
198 the first day, the concentration decreased slowly until day 3, where it was significantly lower (from
199 143 μg/g soil to 72 μg/g soil, $p < 0.05$, Table A4 and A5, Figure 2B). The total organic carbon (Figure
200 B1) and total nitrogen (Figure B2) showed slight temporal changes (Table A4) that were not
201 significant (Table A5).

202

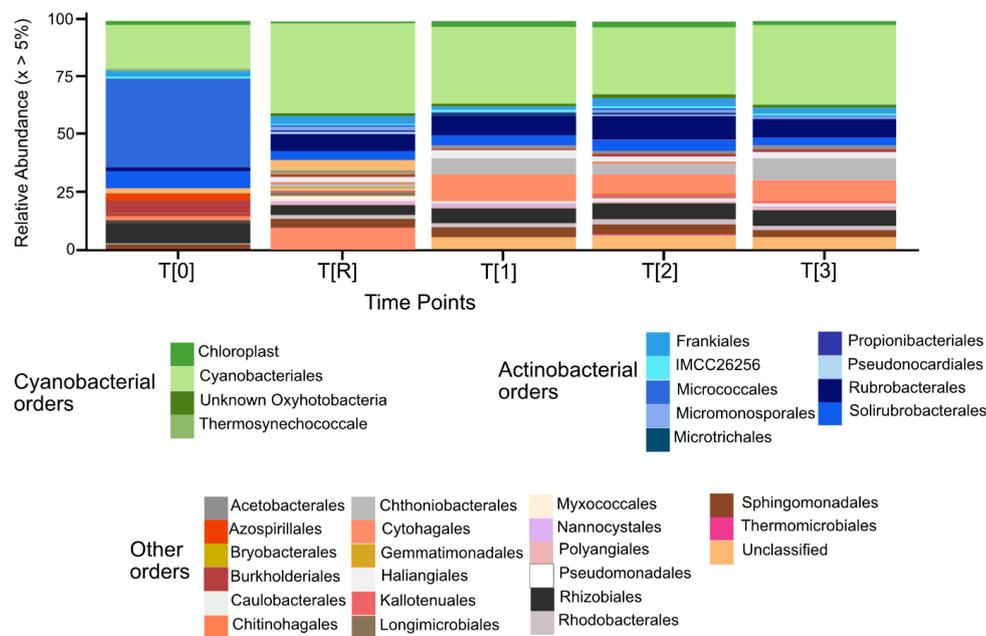

203 Figure 2A. Chlorophyll content (in mg chl a/g soil) (boxplot) and water content (in %) (line and points)
204 for each time point. Both increase at T[R] and decrease rapidly after.

205 Figure 2B. Carbohydrate concentration (in $\mu\text{g/g}$ soil) (boxplot) for each time point. The concentration
206 increases rapidly after the rain event and decreases slowly until T[3].

207 **3.2. Temporal changes in the microbial community composition**

208 Figure 3 shows the bacterial community composition at the order level for each sampling point. The
 209 community is mostly composed of the phyla *Cyanobacteria*, *Actinobacteria*, and *Proteobacteria*
 210 (Figure 3; Table A6). During the dry season, biocrust community composition differed significantly
 211 from the community depicted during the rain event (Table A7). The differences were shown mostly in
 212 orders belonging to the *Actinobacteria* and *Cyanobacteria* phyla (Figure 3; $p < 0.05$, Table A7). The
 213 relative abundance of *Cyanobacteria*, dominated by the *Cyanobacteriales*, increased during the rain
 214 event (from 22% to 41%, Table A6; $p < 0.05$, Table A7). While the relative abundance of the
 215 *Actinobacteria*, dominated by *Micrococcales*, decreased during the rain event (from 50% to 19%,
 216 Table A6; $p < 0.05$, Table A7). In the days following the rain event, no major changes were detected
 217 in the biocrust community (Figure 3; Table A6 and A7).

218
 219 Figure 3. Relative abundance (in %, $x > 0.05$) at the order level for each time point. The cyanobacterial
 220 orders are gathered and in different shades of green, the actinobacterial orders are gathered and in
 221 different shades of blue, and the rest of the orders are gathered alphabetically. The abundance of

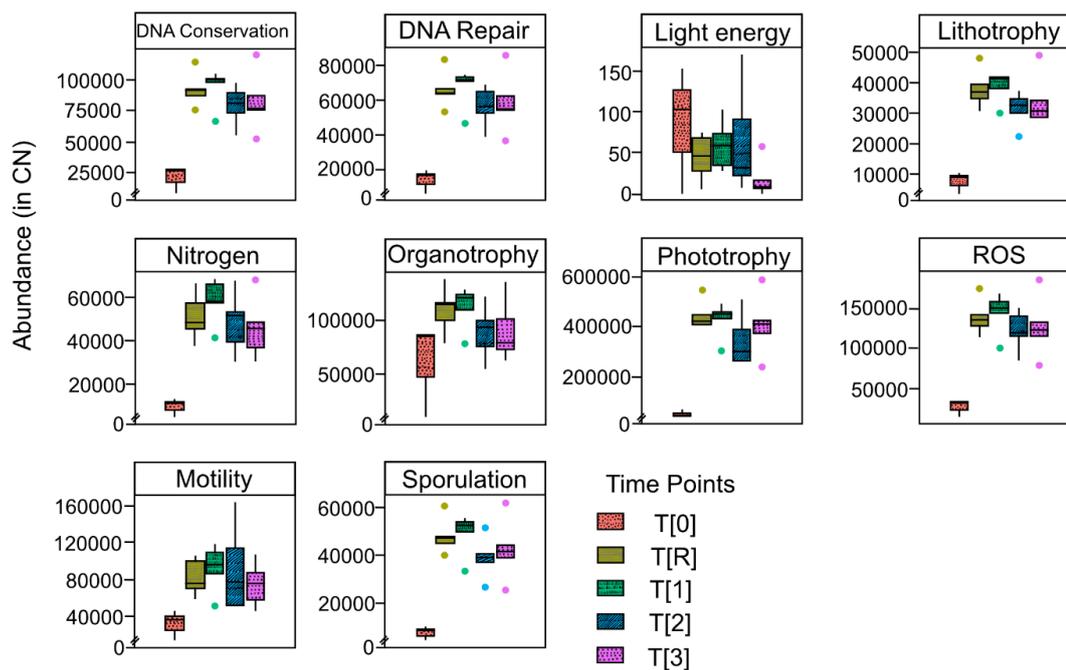

222 Cyanobacterial orders decreases at T[R], while the abundance of the Actinobacterial orders increases
223 at T[R].

224

225 3.3. Temporal changes in the microbial function

226 Figure 4 shows the predicted function based on the taxonomic composition using Piphillin displayed
227 in copy number (CN). The values were significantly lower ($p < 0.03$; Table A9) in the dry season
228 compared to the hydration-desiccation cycle, except for light and energy sensing (Figure 4; Table A8).

229

230 Figure 4. Boxplots of the functional prediction of the 16S sequences. Each panel (Boxplot) represents
231 a different group of genes associated with a certain functionality. The full list of genes can be found in
232 Table A3. The time points are represented by distinct colours and patterns. The y-axis is the
233 abundance in copy number (CN) normalized to the 16S rRNA copy number for each genome.

234 **4. DISCUSSION**

235 Biocrust bacterial communities were shown to alter during hydration (Angel and Conrad, 2013; Meier
236 et al., 2021). Most apparent was the change in the relative abundance of Cyanobacteria which
237 increased while the abundance of Actinobacteria decreased (Figure 3), similar to results obtained
238 under controlled conditions where the biocrust was hydrated to saturation (Angel and Conrad, 2013).
239 Likewise, the filamentous cyanobacterium *Leptolyngbya* sp. isolated from the Negev Desert biocrust,
240 was shown to respond quickly to both hydration and desiccation (Oren et al., 2019, 2017). Even slight
241 increases in biocrust moisture, triggered by dew simulation, were shown to induce DNA repair and
242 associated regulatory genes, activating the photosynthetic system of the cyanobacterium (Rajeev et al.,
243 2013; Murik et al., 2017). In the field, a rain event significantly increases soil moisture (Figure 2A),
244 activating various cyanobacterial orders (Figure 3) that trigger their photosynthesis system (Figure 4),
245 resulting in a sharp rise in bacterial chlorophyll a (Figure 2A) and carbohydrates (Figure 2B)
246 concentrations. The concentration of the chlorophyll pigment was suggested to be linked to the soil
247 water content (Péli et al., 2011) and to the activity of the biocrust primary producers, i.e.,
248 Cyanobacteria and/or green algae.

249

250 While the cyanobacterial activity increased with soil moisture (Figure 2A), no significant changes
251 were detected in the total organic carbon and nitrogen content (Figure B1 and B2; Table A4 and A5).
252 This observation suggests that the immediate change in these parameters is negligible compared to
253 existing soil reservoir; thus, it cannot be used as an indicator for the resuscitation of the local microbial
254 community during rain events. Moreover, it was recently proposed that in arid biocrusts, the dominant
255 Cyanobacteria phylum exchanges carbon for nitrogen with copiotrophic diazotrophs, thus rapidly
256 utilizing available nutrients to enable their colonisation of the oligotrophic dryland soils (Couradeau et
257 al., 2019).

258 In arid soils, rain events entail a decrease in the abundance of Actinobacteria both in the biocrust
259 (Angel and Conrad, 2013) and topsoil (Št'oviček et al., 2017; Barnard et al., 2013). Members of this
260 phylum were shown to be well adapted to harsh environments (Goodfellow and Williams, 1983;

261 Zvyagintsev et al., 2007), and were found to be abundant in the Negev Highland biocrust (Meier et al.,
262 2021). Here, we showed that the increase of water content may lead to an increase in activity in all
263 gene groups linked to energy usage or production (Figure 4; Table A9). The generally dry biocrust,
264 experiences a narrow window of hydration conditions after a rain event (Figure 2A) that needs to be
265 rapidly exploited by the primary producers before the soil dries (Figure 2A and 2B). Concomitantly,
266 the resilient heterotrophs are mitigated, as was previously shown in controlled (Cordero et al., 2019;
267 Greening et al., 2016; León-Sobrino et al., 2019; Tveit et al., 2019), and natural settings (León-
268 Sobrino et al., 2019).

269 The microbial community quickly responds to hydration (Figure 3). However, the response to
270 desiccation is slower despite the rapid drying of the biocrust (Figure 2A) due to evaporation, expedited
271 by strong radiation, high winds, and low air humidity (Kidron and Tal, 2012). Unlike the response to
272 dew hydration-desiccation cycles (Oren et al., 2019, 2017), the community does not immediately
273 inactivate, when the water content in the soil decreases. In a previous study (Št'ovíček et al., 2017), we
274 showed that the topsoil community bounces back to its original structure as the soil dries. In the
275 biocrust, while dehydration was associated to a decrease in chlorophyll concentrations (Figure 2A),
276 there was no significant changes in the community composition (Figure 3). The concentration of
277 carbohydrates, the main components of EPS, follows the same pattern as chlorophyll. In controlled
278 experiments, it was shown that Cyanobacteria secrete copious amounts of EPS that bind the soil
279 particles (Kidron and Tal, 2012; Kidron et al., 2020) and retain water in the soil, slowing down the
280 drying process (Roberson and Firestone, 1992). EPS in the soil also create microhabitats that retain
281 humidity (Colica et al., 2014), thus protecting the residing microorganisms from desiccation (Mazor et
282 al., 1996; Mager and Thomas, 2011). In the Negev desert, a similar impact of the EPS production can
283 be seen. Indeed, it may benefit soil microbial community by creating microhabitats in which moisture
284 is retained longer, enabling an extended active phase following a rain event. This extra active time
285 after a rain event enables longer photosynthesis. This provides access to organic molecules that may
286 justify the ample resources invested by the Cyanobacteria in EPS production (Mager and Thomas,
287 2011). EPS was known as a key component in the Negev Desert for maintaining the structural

288 integrity of the biocrust (Kidron et al., 2020) but it seems to help also sustaining the activity of the soil
289 bacterial communities that inhabit the biocrust.

290

291

292 5. CONCLUSIONS

293 In desert biocrusts, bacterial communities must respond quickly and efficiently to hydration, to take
294 advantage of this short window of opportunity and sequester nutrients. This fleeting abundance
295 requires the bacterial community to be equally adapt to the onset of desiccation and prevent cells
296 damage. Our findings reinforce controlled studies showing that biocrust hydration change the bacterial
297 community and increasing cyanobacterial relative abundance over *Actinobacteria*. Here, we have
298 shown that the response to biocrust desiccation following a rain event is slower than after a dew event,
299 allowing the primary producers to be active even after the soil moisture decreases. This lag in response
300 to dehydration could be associated to water retention by the newly secreted EPS, mediated by the
301 *Cyanobacteria* activity surge. This grace period may justify the metabolic cost of polysaccharides
302 exhaustive production that quickly follows rain events in the desert.

303

304 **ACKNOWLEDGEMENTS**

305 The authors are grateful to Lusine Ghazaryan for technical support and to Ben Poodiack for editing the
306 manuscript. This study was partially supported by the Israel Science Academy, grant no. 993/11.

307 **DATA AVAILABILITY**

308 The data (raw reads) are available in Bioproject under the submission number PRJNA718159.

309 **COMPETING INTERESTS**

310 The authors declare that they have no conflict of interest.

311 **AUTHORS CONTRIBUTIONS**

312 CB, OG and HS conceptualized and designed the methodology; CB and OG collected the
313 samples and metadata; CB and NR did the laboratory work and sequencing; CB did the
314 formal analysis, visualization, data curation and wrote the manuscript; CB, OG, HS and NR
315 did the reviewing and editing of the manuscript.

544

545

546 Table A3. List of the genes used for function prediction ordered by groups and subgroups.

Group	Metabolic traits	KEGG ID	Function
DNA conservation	Putative DNA-binding protein	K02524	K10; DNA binding protein (fs(1)K10, female sterile(1)K10)
	Putative DNA-binding protein	K03111	ssb; single-strand DNA-binding protein
	Putative DNA-binding protein	K03530	hupB; DNA-binding protein HU-beta
	Putative DNA-binding protein	K03622	ssh10b; archaea-specific DNA-binding protein
	Putative DNA-binding protein	K03746	hns; DNA-binding protein H-NS
	Putative DNA-binding protein	K04047	dps; starvation-inducible DNA-binding protein
	Putative DNA-binding protein	K04494	CHD8, HELSNF1; chromodomain helicase DNA binding protein 8 [EC:3.6.4.12]
	Putative DNA-binding protein	K04680	ID1; DNA-binding protein inhibitor ID1
	Putative DNA-binding protein	K05516	cbpA; curved DNA-binding protein
	Putative DNA-binding protein	K05732	ARHGAP35, GRLF1; glucocorticoid receptor DNA-binding factor 1
	Putative DNA-binding protein	K05787	hupA; DNA-binding protein HU-alpha
	Putative DNA-binding protein	K09061	GCF, C2orf3; GC-rich sequence DNA-binding factor
	Putative DNA-binding protein	K09423	BAS1; Myb-like DNA-binding protein BAS1
	Putative DNA-binding protein	K09424	REB1; Myb-like DNA-binding protein REB1
	Putative DNA-binding protein	K09425	K09425; Myb-like DNA-binding protein FlbD
	Putative DNA-binding protein	K09426	RAP1; Myb-like DNA-binding protein RAP1
	Putative DNA-binding protein	K10140	DDB2; DNA damage-binding protein 2
	Putative DNA-binding protein	K10610	DDB1; DNA damage-binding protein 1
	Putative DNA-binding protein	K10728	TOPBP1; topoisomerase (DNA) II binding protein 1
	Putative DNA-binding protein	K10748	tus, tau; DNA replication terminus site-binding protein
	Histone-like protein	K10752	RBBP4, HAT2, CAF1, MIS16; histone-binding protein RBBP4
Putative DNA-binding protein	K10979	ku; DNA end-binding protein Ku	
Putative DNA-binding protein	K11367	CHD1; chromodomain-helicase-DNA-binding protein 1 [EC:3.6.4.12]	
Histone-like protein	K11495	CENPA; histone H3-like centromeric protein A	

Putative DNA-binding protein	K11574	CBF2, CBF3A, CTF14; centromere DNA-binding protein complex CBF3 subunit A
Putative DNA-binding protein	K11575	CEP3, CBF3B; centromere DNA-binding protein complex CBF3 subunit B
Putative DNA-binding protein	K11576	CTF13, CBF3C; centromere DNA-binding protein complex CBF3 subunit C
Putative DNA-binding protein	K11642	CHD3, MI2A; chromodomain-helicase-DNA-binding protein 3 [EC:3.6.4.12]
Putative DNA-binding protein	K11643	CHD4, MI2B; chromodomain-helicase-DNA-binding protein 4 [EC:3.6.4.12]
Histone-like protein	K11659	RBBP7; histone-binding protein RBBP7
Putative DNA-binding protein	K11685	stpA; DNA-binding protein StpA
Putative DNA-binding protein	K12965	ZBP1, DAI; Z-DNA binding protein 1
Putative DNA-binding protein	K13102	KIN; DNA/RNA-binding protein KIN17
Putative DNA-binding protein	K13211	GCFC; GC-rich sequence DNA-binding factor
Putative DNA-binding protein	K14435	CHD5; chromodomain-helicase-DNA-binding protein 5 [EC:3.6.4.12]
Putative DNA-binding protein	K14436	CHD6; chromodomain-helicase-DNA-binding protein 6 [EC:3.6.4.12]
Putative DNA-binding protein	K14437	CHD7; chromodomain-helicase-DNA-binding protein 7 [EC:3.6.4.12]
Putative DNA-binding protein	K14438	CHD9; chromodomain-helicase-DNA-binding protein 9 [EC:3.6.4.12]
Putative DNA-binding protein	K14507	ORCA2_3; AP2-domain DNA-binding protein ORCA2/3
Histone-like protein	K15719	NCOAT, MGEA5; protein O-GlcNAcase / histone acetyltransferase [EC:3.2.1.169 2.3.1.48]
Putative DNA-binding protein	K16640	ssh7; DNA-binding protein 7 [EC:3.1.27.-]
Putative DNA-binding protein	K17693	ID2; DNA-binding protein inhibitor ID2
Putative DNA-binding protein	K17694	ID3; DNA-binding protein inhibitor ID3
Putative DNA-binding protein	K17695	ID4; DNA-binding protein inhibitor ID4
Putative DNA-binding protein	K17696	EMC; DNA-binding protein inhibitor ID, other
Histone-like protein	K18710	SLBP; histone RNA hairpin-binding protein
Putative DNA-binding protein	K18946	gp32, ssb; single-stranded DNA-binding protein
Putative DNA-binding protein	K19442	ICP8, DBP, UL29; Simplexvirus major DNA-binding protein
Histone-like protein	K19799	RPH1; DNA damage-responsive transcriptional repressor / [histone H3]-trimethyl-L-lysine36 demethylase [EC:1.14.11.69]
Putative DNA-binding protein	K20091	CHD2; chromodomain-helicase-DNA-binding protein 2 [EC:3.6.4.12]

	Putative DNA-binding protein	K20092	CHD1L; chromodomain-helicase-DNA-binding protein 1-like [EC:3.6.4.12]
	Putative DNA-binding protein	K22592	AHDC1; AT-hook DNA-binding motif-containing protein 1
	Putative DNA-binding protein	K23225	SATB1; DNA-binding protein SATB1
	Putative DNA-binding protein	K23226	SATB2; DNA-binding protein SATB2
	Putative DNA-binding protein	K23600	TARDBP, TDP43; TAR DNA-binding protein 43
DNA repair	DNA polymerase PolA (COG0258)	K02320	POLA1; DNA polymerase alpha subunit A [EC:2.7.7.7]
	DNA polymerase PolA (COG0258)	K02321	POLA2; DNA polymerase alpha subunit B
	DNA polymerase PolA (COG0258)	K02335	polA; DNA polymerase I [EC:2.7.7.7]
	DNA polymerase IV	K02346	dinB; DNA polymerase IV [EC:2.7.7.7]
	Exodeoxyribonuclease VII	K03601	xseA; exodeoxyribonuclease VII large subunit [EC:3.1.11.6]
	Exodeoxyribonuclease VII	K03602	xseB; exodeoxyribonuclease VII small subunit [EC:3.1.11.6]
	DNA polymerase IV	K04479	dbh; DNA polymerase IV (archaeal DinB-like DNA polymerase) [EC:2.7.7.7]
	Exodeoxyribonuclease VII	K10906	recE; exodeoxyribonuclease VIII [EC:3.1.11.-]
	DNA polymerase IV	K10981	POL4; DNA polymerase IV [EC:2.7.7.7]
	DNA polymerase IV	K16250	NRPD1; DNA-directed RNA polymerase IV subunit 1 [EC:2.7.7.6]
	DNA polymerase IV	K16252	NRPD2, NRPE2; DNA-directed RNA polymerase IV and V subunit 2 [EC:2.7.7.6]
	DNA polymerase IV	K16253	NRPD7, NRPE7; DNA-directed RNA polymerase IV and V subunit 7
	Lithotrophy	NiFe hydrogenase	K00437
NiFe hydrogenase		K02587	nifE; nitrogenase molybdenum-cofactor synthesis protein NifE
CO-dehydrogenase CoxM & CoxS		K03518	coxS; aerobic carbon-monoxide dehydrogenase small subunit [EC:1.2.5.3]
CO-dehydrogenase CoxM & CoxS		K03519	coxM, cutM; aerobic carbon-monoxide dehydrogenase medium subunit [EC:1.2.5.3]
CO-dehydrogenase large subunit (coxL) Form I		K03520	CoxL, cutL; aerobic carbon-monoxide dehydrogenase large subunit [EC:1.2.5.3]
NiFe hydrogenase		K05586	hoxE ; bidirectional [NiFe] hydrogenase diaphorase subunit [EC:7.1.1.2]
NiFe hydrogenase		K05587	hoxF; bidirectional [NiFe] hydrogenase diaphorase subunit [EC:7.1.1.2]
NiFe hydrogenase		K05588	hoxU ; bidirectional [NiFe] hydrogenase diaphorase subunit [EC:7.1.1.2]
SOX sulfur-oxidation system		K17218	sqr; sulfide:quinone oxidoreductase [EC:1.8.5.4]

	SOX sulfur-oxidation system	K17222	soxA; L-cysteine S-thiosulfotransferase [EC:2.8.5.2]
	SOX sulfur-oxidation system	K17223	soxX; L-cysteine S-thiosulfotransferase [EC:2.8.5.2]
	SOX sulfur-oxidation system	K17224	soxB; S-sulfosulfanyl-L-cysteine sulfohydrolase [EC:3.1.6.20]
	SOX sulfur-oxidation system	K17225	soxC ; sulfane dehydrogenase subunit SoxC
	SOX sulfur-oxidation system	K17226	soxY; sulfur-oxidizing protein SoxY
	SOX sulfur-oxidation system	K17227	soxZ; sulfur-oxidizing protein SoxZ
	NiFe hydrogenase	K18005	hoxF; [NiFe] hydrogenase diaphorase moiety large subunit [EC:1.12.1.2]
	NiFe hydrogenase	K18006	hoxU; [NiFe] hydrogenase diaphorase moiety small subunit [EC:1.12.1.2]
	NiFe hydrogenase	K18008	hydA; [NiFe] hydrogenase small subunit [EC:1.12.2.1]
	Propane monooxygenase (soluble)	K18223	prmA ; propane 2-monooxygenase large subunit [EC:1.14.13.227]
	Propane monooxygenase (soluble)	K18224	prmC; propane 2-monooxygenase small subunit [EC:1.14.13.227]
	Propane monooxygenase (soluble)	K18225	prmB; propane monooxygenase reductase component [EC:1.18.1.-]
	Propane monooxygenase (soluble)	K18226	prmD; propane monooxygenase coupling protein
	SOX sulfur-oxidation system	K22622	soxD; S-disulfanyl-L-cysteine oxidoreductase SoxD [EC:1.8.2.6]
	SOX sulfur-oxidation system	K24007	soxD; cytochrome aa3-type oxidase subunit SoxD
	SOX sulfur-oxidation system	K24008	soxC; cytochrome aa3-type oxidase subunit III
	SOX sulfur-oxidation system	K24009	soxB; cytochrome aa3-type oxidase subunit I [EC:7.1.1.4]
	SOX sulfur-oxidation system	K24010	soxA; cytochrome aa3-type oxidase subunit II [EC:7.1.1.4]
	SOX sulfur-oxidation system	K24011	soxM; cytochrome aa3-type oxidase subunit I/III [EC:7.1.1.4]
Organotrophy	ABC sugar transporters	K02025	ABC.MS.P; multiple sugar transport system permease protein
	ABC sugar transporters	K02026	ABC.MS.P1; multiple sugar transport system permease protein
	ABC sugar transporters	K02027	ABC.MS.S; multiple sugar transport system substrate-binding protein
	ABC sugar transporters	K02056	ABC.SS.A; simple sugar transport system ATP-binding protein [EC:7.5.2.-]
	ABC sugar transporters	K02057	ABC.SS.P; simple sugar transport system permease protein
	ABC sugar transporters	K02058	ABC.SS.S; simple sugar transport system substrate-binding protein

PTS sugar importers	K02777	crr; sugar PTS system EIIA component [EC:2.7.1.-]
Amino acid transporter	K03293	TC.AAT; amino acid transporter, AAT family
Peptide transporter	K03305	TC.POT; proton-dependent oligopeptide transporter, POT family
Amino acid transporter	K03311	TC.LIVCS; branched-chain amino acid:cation transporter, LIVCS family
Carboxylate transporters	K03326	TC.DCUC, dcuC, dcuD; C4-dicarboxylate transporter, DcuC family
Amino acid transporter	K03450	SLC7A; solute carrier family 7 (L-type amino acid transporter), other
Glycosyl hydrolases	K04844	ycjT; hypothetical glycosyl hydrolase [EC:3.2.1.-]
Amino acid transporter	K05048	SLC6A15S; solute carrier family 6 (neurotransmitter transporter, amino acid/orphan) member 15/16/17/18/20
Amino acid transporter	K05615	SLC1A4, SATT; solute carrier family 1 (neutral amino acid transporter), member 4
Amino acid transporter	K05616	SLC1A5; solute carrier family 1 (neutral amino acid transporter), member 5
Amino acid transporter	K07084	yuiF; putative amino acid transporter
Carboxylate transporters	K07791	dcuA ; anaerobic C4-dicarboxylate transporter DcuA
Carboxylate transporters	K07792	dcuB; anaerobic C4-dicarboxylate transporter DcuB
ABC sugar transporters	K10546	ABC.GGU.S, chvE; putative multiple sugar transport system substrate-binding protein
ABC sugar transporters	K10547	ABC.GGU.P, gguB; putative multiple sugar transport system permease protein
ABC sugar transporters	K10548	ABC.GGU.A, gguA; putative multiple sugar transport system ATP-binding protein [EC:7.5.2.-]
Carboxylate transporters	K11689	dctQ ; C4-dicarboxylate transporter, DctQ subunit
Carboxylate transporters	K11690	dctM; C4-dicarboxylate transporter, DctM subunit
Amino acid transporter	K13576	SLC38A3, SNAT3; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 3
Carboxylate transporters	K13577	SLC25A10, DIC; solute carrier family 25 (mitochondrial dicarboxylate transporter), member 10
Amino acid transporter	K13780	SLC7A5, LAT1; solute carrier family 7 (L-type amino acid transporter), member 5
Amino acid transporter	K13781	SLC7A8, LAT2; solute carrier family 7 (L-type amino acid transporter), member 8
Amino acid transporter	K13782	SLC7A10, ASC1; solute carrier family 7 (L-type amino acid transporter), member 10
Amino acid transporter	K13863	SLC7A1, ATRC1; solute carrier family 7 (cationic amino acid transporter), member 1
Amino acid transporter	K13864	SLC7A2, ATRC2; solute carrier family 7 (cationic amino acid transporter), member 2

Amino acid transporter	K13865	SLC7A3, ATRC3; solute carrier family 7 (cationic amino acid transporter), member 3
Amino acid transporter	K13866	SLC7A4; solute carrier family 7 (cationic amino acid transporter), member 4
Amino acid transporter	K13867	SLC7A7; solute carrier family 7 (L-type amino acid transporter), member 7
Amino acid transporter	K13868	SLC7A9, BAT1; solute carrier family 7 (L-type amino acid transporter), member 9
Amino acid transporter	K13869	SLC7A11; solute carrier family 7 (L-type amino acid transporter), member 11
Amino acid transporter	K13870	SLC7A13, AGT1; solute carrier family 7 (L-type amino acid transporter), member 13
Amino acid transporter	K13871	SLC7A14; solute carrier family 7 (cationic amino acid transporter), member 14
Amino acid transporter	K13872	SLC7A6; solute carrier family 7 (L-type amino acid transporter), member 6
Peptide transporter	K14206	SLC15A1, PEPT1; solute carrier family 15 (oligopeptide transporter), member 1
Amino acid transporter	K14207	SLC38A2, SNAT2; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 2
Amino acid transporter	K14209	SLC36A, PAT; solute carrier family 36 (proton-coupled amino acid transporter)
Amino acid transporter	K14210	SLC3A1, RBAT; solute carrier family 3 (neutral and basic amino acid transporter), member 1
Carboxylate transporters	K14388	SLC5A8_12, SMCT; solute carrier family 5 (sodium-coupled monocarboxylate transporter), member 8/12
Carboxylate transporters	K14445	SLC13A2_3_5; solute carrier family 13 (sodium-dependent dicarboxylate transporter), member 2/3/5
Peptide transporter	K14637	SLC15A2, PEPT2; solute carrier family 15 (oligopeptide transporter), member 2
Peptide transporter	K14638	SLC15A3_4, PHT; solute carrier family 15 (peptide/histidine transporter), member 3/4
Amino acid transporter	K14990	SLC38A1, SNAT1, GLNT; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 1
Amino acid transporter	K14991	SLC38A4, SNAT4; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 4
Amino acid transporter	K14992	SLC38A5, SNAT5; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 5
Amino acid transporter	K14993	SLC38A6, SNAT6; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 6
Amino acid transporter	K14994	SLC38A7_8; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 7/8
Amino acid transporter	K14995	SLC38A9; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 9

	Amino acid transporter	K14996	SLC38A10; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 10
	Amino acid transporter	K14997	SLC38A11; solute carrier family 38 (sodium-coupled neutral amino acid transporter), member 11
	Amino acid transporter	K15015	SLC32A, VGAT; solute carrier family 32 (vesicular inhibitory amino acid transporter)
	Carboxylate transporters	K15110	SLC25A21, ODC; solute carrier family 25 (mitochondrial 2-oxodicarboxylate transporter), member 21
	Amino acid transporter	K16261	YAT; yeast amino acid transporter
	Amino acid transporter	K16263	yjeH; amino acid efflux transporter
	Peptide transporter	K17938	sbmA, bacA; peptide/bleomycin uptake transporter
Phototrophy	RuBisCO	K01601	rbcL; ribulose-bisphosphate carboxylase large chain [EC:4.1.1.39]
	Chlorophyll synthesis	K01669	phrB; deoxyribodipyrimidine photo-lyase [EC:4.1.99.3]
	Chlorophyll synthesis	K02689	psaA; photosystem I P700 chlorophyll a apoprotein A1
	Chlorophyll synthesis	K02690	psaB; photosystem I P700 chlorophyll a apoprotein A2
	Chlorophyll synthesis	K02691	psaC; photosystem I subunit VII
	Chlorophyll synthesis	K02692	psaD; photosystem I subunit II
	Chlorophyll synthesis	K02693	psaE; photosystem I subunit IV
	Chlorophyll synthesis	K02694	psaF; photosystem I subunit III
	Chlorophyll synthesis	K02695	psaH; photosystem I subunit VI
	Chlorophyll synthesis	K02696	psaI; photosystem I subunit VIII
	Chlorophyll synthesis	K02697	psaJ; photosystem I subunit IX
	Chlorophyll synthesis	K02698	psaK; photosystem I subunit X
	Chlorophyll synthesis	K02699	psaL; photosystem I subunit XI
	Chlorophyll synthesis	K02700	psaM; photosystem I subunit XII
	Chlorophyll synthesis	K02701	psaN; photosystem I subunit PsaN
	Chlorophyll synthesis	K02702	psaX; photosystem I 4.8kDa protein
	Chlorophyll synthesis	K02703	psbA; photosystem II P680 reaction center D1 protein [EC:1.10.3.9]
Chlorophyll synthesis	K02704	psbB; photosystem II CP47 chlorophyll apoprotein	

Chlorophyll synthesis	K02705	psbC; photosystem II CP43 chlorophyll apoprotein
Chlorophyll synthesis	K02706	psbD; photosystem II P680 reaction center D2 protein [EC:1.10.3.9]
Chlorophyll synthesis	K02707	psbE; photosystem II cytochrome b559 subunit alpha
Chlorophyll synthesis	K02708	psbF; photosystem II cytochrome b559 subunit beta
Chlorophyll synthesis	K02709	psbH; photosystem II PsbH protein
Chlorophyll synthesis	K02710	psbI; photosystem II PsbI protein
Chlorophyll synthesis	K02711	psbJ; photosystem II PsbJ protein
Chlorophyll synthesis	K02712	psbK; photosystem II PsbK protein
Chlorophyll synthesis	K02713	psbL; photosystem II PsbL protein
Chlorophyll synthesis	K02714	psbM; photosystem II PsbM protein
Chlorophyll synthesis	K02716	psbO; photosystem II oxygen-evolving enhancer protein 1
Chlorophyll synthesis	K02717	psbP; photosystem II oxygen-evolving enhancer protein 2
Chlorophyll synthesis	K02718	psbT; photosystem II PsbT protein
Chlorophyll synthesis	K02719	psbU; photosystem II PsbU protein
Chlorophyll synthesis	K02720	psbV; photosystem II cytochrome c550
Chlorophyll synthesis	K02721	psbW; photosystem II PsbW protein
Chlorophyll synthesis	K02722	psbX; photosystem II PsbX protein
Chlorophyll synthesis	K02723	psbY; photosystem II PsbY protein
Chlorophyll synthesis	K02724	psbZ; photosystem II PsbZ protein
Chlorophyll synthesis	K03157	LTB, TNFC; lymphotoxin beta (TNF superfamily, member 3)
Chlorophyll synthesis	K03159	TNFRSF3, LTBR; lymphotoxin beta receptor TNFR superfamily member 3
Chlorophyll synthesis	K03541	psbR; photosystem II 10kDa protein
Chlorophyll synthesis	K03542	psbS; photosystem II 22kDa protein
Chlorophyll synthesis	K03716	splB; spore photoproduct lyase [EC:4.1.99.14]
Chlorophyll synthesis	K05468	LTA, TNFB; lymphotoxin alpha (TNF superfamily, member 1)
Chlorophyll synthesis	K06315	splA; transcriptional regulator of the spore photoproduct lyase operon
Chlorophyll synthesis	K06876	K06876; deoxyribodipyrimidine photolyase-related protein

	Chlorophyll synthesis	K08901	psbQ; photosystem II oxygen-evolving enhancer protein 3
	Chlorophyll synthesis	K08902	psb27; photosystem II Psb27 protein
	Chlorophyll synthesis	K08903	psb28; photosystem II 13kDa protein
	Chlorophyll synthesis	K08904	psb28-2; photosystem II Psb28-2 protein
	Chlorophyll synthesis	K08905	psaG; photosystem I subunit V
	Chlorophyll synthesis	K08928	pufL; photosynthetic reaction center L subunit
	Chlorophyll synthesis	K08929	pufM; photosynthetic reaction center M subunit
	Chlorophyll synthesis	K08940	pscA; photosystem P840 reaction center large subunit
	Chlorophyll synthesis	K08941	pscB; photosystem P840 reaction center iron-sulfur protein
	Chlorophyll synthesis	K08942	pscC; photosystem P840 reaction center cytochrome c551
	Chlorophyll synthesis	K08943	pscD; photosystem P840 reaction center protein PscD
	Chlorophyll synthesis	K11524	pixI ; positive phototaxis protein PixI
	Chlorophyll synthesis	K13991	puhA; photosynthetic reaction center H subunit
	Chlorophyll synthesis	K13992	pufC; photosynthetic reaction center cytochrome c subunit
	Chlorophyll synthesis	K13994	pufX; photosynthetic reaction center PufX protein
	Chlorophyll synthesis	K14332	psaO; photosystem I subunit PsaO
	Chlorophyll synthesis	K19016	IMPG1, SPACR; interphotoreceptor matrix proteoglycan 1
	Chlorophyll synthesis	K19017	IMPG2, SPACRCAN; interphotoreceptor matrix proteoglycan 2
	Chlorophyll synthesis	K20715	PHOT; phototropin [EC:2.7.11.1]
	Chlorophyll synthesis	K22464	FAP; fatty acid photodecarboxylase [EC:4.1.1.106]
	Chlorophyll synthesis	K22619	Aequorin; calcium-regulated photoprotein [EC:1.13.12.24]
	Chlorophyll synthesis	K24165	PCARE; photoreceptor cilium actin regulator
ROS-damage prevention	Cytochrome C oxidase	K00404	ccoN; cytochrome c oxidase cbb3-type subunit I [EC:7.1.1.9]
	Cytochrome C oxidase	K00405	ccoO; cytochrome c oxidase cbb3-type subunit II
	Cytochrome C oxidase	K00406	ccoP; cytochrome c oxidase cbb3-type subunit III
	Cytochrome C oxidase	K00407	ccoQ; cytochrome c oxidase cbb3-type subunit IV
	Cytochrome bd ubiquinol oxidase	K00424	cydX; cytochrome bd-I ubiquinol oxidase subunit X [EC:7.1.1.7]

Cytochrome C oxidase	K00424	cydX; cytochrome bd-I ubiquinol oxidase subunit X [EC:7.1.1.7]
Cytochrome bd ubiquinol oxidase	K00425	cydA; cytochrome bd ubiquinol oxidase subunit I [EC:7.1.1.7]
Cytochrome C oxidase	K00425	cydA; cytochrome bd ubiquinol oxidase subunit I [EC:7.1.1.7]
Cytochrome bd ubiquinol oxidase	K00426	cydB; cytochrome bd ubiquinol oxidase subunit II [EC:7.1.1.7]
Cytochrome C oxidase	K00426	cydB; cytochrome bd ubiquinol oxidase subunit II [EC:7.1.1.7]
Cytochrome C oxidase	K00428	E1.11.1.5; cytochrome c peroxidase [EC:1.11.1.5]
Cytochrome C oxidase	K02256	COX1; cytochrome c oxidase subunit 1 [EC:7.1.1.9]
Cytochrome C oxidase	K02258	COX11, ctaG; cytochrome c oxidase assembly protein subunit 11
Cytochrome C oxidase	K02259	COX15, ctaA; cytochrome c oxidase assembly protein subunit 15
Cytochrome C oxidase	K02260	COX17; cytochrome c oxidase assembly protein subunit 17
Cytochrome C oxidase	K02261	COX2; cytochrome c oxidase subunit 2
Cytochrome C oxidase	K02262	COX3; cytochrome c oxidase subunit 3
Cytochrome C oxidase	K02263	COX4; cytochrome c oxidase subunit 4
Cytochrome C oxidase	K02264	COX5A; cytochrome c oxidase subunit 5a
Cytochrome C oxidase	K02265	COX5B; cytochrome c oxidase subunit 5b
Cytochrome C oxidase	K02266	COX6A; cytochrome c oxidase subunit 6a
Cytochrome C oxidase	K02267	COX6B; cytochrome c oxidase subunit 6b
Cytochrome C oxidase	K02268	COX6C; cytochrome c oxidase subunit 6c
Cytochrome C oxidase	K02269	COX7; cytochrome c oxidase subunit 7
Cytochrome C oxidase	K02270	COX7A; cytochrome c oxidase subunit 7a
Cytochrome C oxidase	K02271	COX7B; cytochrome c oxidase subunit 7b
Cytochrome C oxidase	K02272	COX7C; cytochrome c oxidase subunit 7c
Cytochrome C oxidase	K02273	COX8; cytochrome c oxidase subunit 8
Cytochrome C oxidase	K02274	coxA, ctaD; cytochrome c oxidase subunit I [EC:7.1.1.9]
Cytochrome C oxidase	K02275	coxB, ctaC; cytochrome c oxidase subunit II [EC:7.1.1.9]
Cytochrome C oxidase	K02276	coxC, ctaE; cytochrome c oxidase subunit III [EC:7.1.1.9]
Cytochrome C oxidase	K02277	coxD, ctaF; cytochrome c oxidase subunit IV [EC:7.1.1.9]

Cytochrome C oxidase	K02297	cyoA; cytochrome o ubiquinol oxidase subunit II [EC:7.1.1.3]
Cytochrome C oxidase	K02298	cyoB; cytochrome o ubiquinol oxidase subunit I [EC:7.1.1.3]
Cytochrome C oxidase	K02299	cyoC; cytochrome o ubiquinol oxidase subunit III
Cytochrome C oxidase	K02300	cyoD; cytochrome o ubiquinol oxidase subunit IV
Cytochrome C oxidase	K02826	qoxA ; cytochrome aa3-600 menaquinol oxidase subunit II [EC:7.1.1.5]
Cytochrome C oxidase	K02827	qoxB; cytochrome aa3-600 menaquinol oxidase subunit I [EC:7.1.1.5]
Cytochrome C oxidase	K02828	qoxC; cytochrome aa3-600 menaquinol oxidase subunit III [EC:7.1.1.5]
Cytochrome C oxidase	K02829	qoxD; cytochrome aa3-600 menaquinol oxidase subunit IV [EC:7.1.1.5]
Mn ²⁺ catalase	K07217	K07217; Mn-containing catalase
Cytochrome C oxidase	K15408	coxAC; cytochrome c oxidase subunit I+III [EC:7.1.1.9]
Cytochrome C oxidase	K15862	ccoNO; cytochrome c oxidase cbb3-type subunit I/II [EC:7.1.1.9]
Cytochrome C oxidase	K18173	COA1; cytochrome c oxidase assembly factor 1
Cytochrome C oxidase	K18174	COA2; cytochrome c oxidase assembly factor 2
Cytochrome C oxidase	K18175	CCDC56, COA3; cytochrome c oxidase assembly factor 3, animal type
Cytochrome C oxidase	K18176	COA3; cytochrome c oxidase assembly factor 3, fungi type
Cytochrome C oxidase	K18177	COA4; cytochrome c oxidase assembly factor 4
Cytochrome C oxidase	K18178	COA5, PET191; cytochrome c oxidase assembly factor 5
Cytochrome C oxidase	K18179	COA6; cytochrome c oxidase assembly factor 6
Cytochrome C oxidase	K18180	COA7, SELRC1, RESA1; cytochrome c oxidase assembly factor 7
Cytochrome C oxidase	K18181	COX14; cytochrome c oxidase assembly factor 14
Cytochrome C oxidase	K18182	COX16; cytochrome c oxidase assembly protein subunit 16
Cytochrome C oxidase	K18183	COX19; cytochrome c oxidase assembly protein subunit 19
Cytochrome C oxidase	K18184	COX20; cytochrome c oxidase assembly protein subunit 20
Cytochrome C oxidase	K18185	COX23; cytochrome c oxidase assembly protein subunit 23
Cytochrome C oxidase	K18189	TACO1; translational activator of cytochrome c oxidase I
Cytochrome bd ubiquinol oxidase	K22501	appX; cytochrome bd-II ubiquinol oxidase subunit AppX [EC:7.1.1.7]
Cytochrome C oxidase	K22501	appX; cytochrome bd-II ubiquinol oxidase subunit AppX [EC:7.1.1.7]

	Cytochrome C oxidase	K24007	soxD; cytochrome aa3-type oxidase subunit SoxD
	Cytochrome C oxidase	K24008	soxC; cytochrome aa3-type oxidase subunit III
	Cytochrome C oxidase	K24009	soxB; cytochrome aa3-type oxidase subunit I [EC:7.1.1.4]
	Cytochrome C oxidase	K24010	soxA; cytochrome aa3-type oxidase subunit II [EC:7.1.1.4]
	Cytochrome C oxidase	K24011	soxM; cytochrome aa3-type oxidase subunit I/III [EC:7.1.1.4]
Sporulation	Glycogen synthesis	K00693	GYS; glycogen synthase [EC:2.4.1.11]
	Sporulation (Actinobacteria)	K02490	spo0F; two-component system, response regulator, stage 0 sporulation protein F
	Sporulation (Actinobacteria)	K02491	kinA; two-component system, sporulation sensor kinase A [EC:2.7.13.3]
	Glycogen synthesis	K03083	GSK3B; glycogen synthase kinase 3 beta [EC:2.7.11.26]
	Sporulation (Actinobacteria)	K03091	sigH; RNA polymerase sporulation-specific sigma factor
	Sporulation (Actinobacteria)	K04769	spoVT; AbrB family transcriptional regulator, stage V sporulation protein T
	Sporulation (Actinobacteria)	K06283	spoIID; putative DeoR family transcriptional regulator, stage III sporulation protein D
	Sporulation (Actinobacteria)	K06348	kapD; sporulation inhibitor KapD
	Sporulation (Actinobacteria)	K06359	rapA, spo0L; response regulator aspartate phosphatase A (stage 0 sporulation protein L) [EC:3.1.-.-]
	Sporulation (Actinobacteria)	K06371	sda; developmental checkpoint coupling sporulation initiation to replication initiation
	Sporulation (Actinobacteria)	K06375	spo0B; stage 0 sporulation protein B (sporulation initiation phosphotransferase) [EC:2.7.-.-]
	Sporulation (Actinobacteria)	K06376	spo0E; stage 0 sporulation regulatory protein
	Sporulation (Actinobacteria)	K06377	spo0M; sporulation-barren protein
	Sporulation (Actinobacteria)	K06378	spoIIAA; stage II sporulation protein AA (anti-sigma F factor antagonist)
	Sporulation (Actinobacteria)	K06379	spoIIAB; stage II sporulation protein AB (anti-sigma F factor) [EC:2.7.11.1]
	Sporulation (Actinobacteria)	K06380	spoIIB; stage II sporulation protein B
	Sporulation (Actinobacteria)	K06381	spoIID; stage II sporulation protein D
	Sporulation (Actinobacteria)	K06382	spoIIE; stage II sporulation protein E [EC:3.1.3.16]
	Sporulation (Actinobacteria)	K06383	spoIIGA; stage II sporulation protein GA (sporulation sigma-E factor processing peptidase) [EC:3.4.23.-]
Sporulation (Actinobacteria)	K06384	spoIIM; stage II sporulation protein M	

Sporulation (Actinobacteria)	K06385	spoIIP; stage II sporulation protein P
Sporulation (Actinobacteria)	K06386	spoIIQ ; stage II sporulation protein Q
Sporulation (Actinobacteria)	K06387	spoIIR; stage II sporulation protein R
Sporulation (Actinobacteria)	K06388	spoIIISA ; stage II sporulation protein SA
Sporulation (Actinobacteria)	K06389	spoIISB; stage II sporulation protein SB
Sporulation (Actinobacteria)	K06390	spoIIIAA; stage III sporulation protein AA
Sporulation (Actinobacteria)	K06391	spoIIIAB; stage III sporulation protein AB
Sporulation (Actinobacteria)	K06392	spoIIIAC; stage III sporulation protein AC
Sporulation (Actinobacteria)	K06393	spoIIIAD; stage III sporulation protein AD
Sporulation (Actinobacteria)	K06394	spoIIIAE; stage III sporulation protein AE
Sporulation (Actinobacteria)	K06395	spoIIIAF; stage III sporulation protein AF
Sporulation (Actinobacteria)	K06396	spoIIIAG; stage III sporulation protein AG
Sporulation (Actinobacteria)	K06397	spoIIIAH; stage III sporulation protein AH
Sporulation (Actinobacteria)	K06398	spoIVA; stage IV sporulation protein A
Sporulation (Actinobacteria)	K06399	spoIVB; stage IV sporulation protein B [EC:3.4.21.116]
Sporulation (Actinobacteria)	K06401	spoIVFA; stage IV sporulation protein FA
Sporulation (Actinobacteria)	K06402	spoIVFB; stage IV sporulation protein FB [EC:3.4.24.-]
Sporulation (Actinobacteria)	K06403	spoVAA; stage V sporulation protein AA
Sporulation (Actinobacteria)	K06404	spoVAB; stage V sporulation protein AB
Sporulation (Actinobacteria)	K06405	spoVAC; stage V sporulation protein AC
Sporulation (Actinobacteria)	K06406	spoVAD; stage V sporulation protein AD
Sporulation (Actinobacteria)	K06407	spoVAE; stage V sporulation protein AE
Sporulation (Actinobacteria)	K06408	spoVAF; stage V sporulation protein AF
Sporulation (Actinobacteria)	K06409	spoVB; stage V sporulation protein B
Sporulation (Actinobacteria)	K06412	spoVG; stage V sporulation protein G
Sporulation (Actinobacteria)	K06413	spoVK; stage V sporulation protein K
Sporulation (Actinobacteria)	K06414	spoVM; stage V sporulation protein M

Sporulation (Actinobacteria)	K06415	spoVR; stage V sporulation protein R
Sporulation (Actinobacteria)	K06416	spoVS; stage V sporulation protein S
Sporulation (Actinobacteria)	K06417	spoVID; stage VI sporulation protein D
Sporulation (Actinobacteria)	K06437	yknT; sigma-E barrenled sporulation protein
Sporulation (Actinobacteria)	K06438	yqfD; similar to stage IV sporulation protein
Sporulation (Actinobacteria)	K07697	kinB; two-component system, sporulation sensor kinase B [EC:2.7.13.3]
Sporulation (Actinobacteria)	K07698	kinC; two-component system, sporulation sensor kinase C [EC:2.7.13.3]
Sporulation (Actinobacteria)	K07699	spo0A; two-component system, response regulator, stage 0 sporulation protein A
Sporulation (Actinobacteria)	K08293	SMK1; sporulation-specific mitogen-activated protein kinase SMK1 [EC:2.7.11.24]
Sporulation (Actinobacteria)	K08384	spoVD; stage V sporulation protein D (sporulation-specific penicillin-binding protein)
Glycogen synthesis	K08822	GSK3A; glycogen synthase kinase 3 alpha [EC:2.7.11.26]
Sporulation (Actinobacteria)	K12576	SPO12; sporulation-specific protein 12
Sporulation (Actinobacteria)	K12771	SPS1; sporulation-specific protein 1 [EC:2.7.11.1]
Sporulation (Actinobacteria)	K12772	SPS4; sporulation-specific protein 4
Sporulation (Actinobacteria)	K12773	SPR3; sporulation-regulated protein 3
Sporulation (Actinobacteria)	K12783	SSP1; sporulation-specific protein 1
Sporulation (Actinobacteria)	K13532	kinD; two-component system, sporulation sensor kinase D [EC:2.7.13.3]
Sporulation (Actinobacteria)	K13533	kinE; two-component system, sporulation sensor kinase E [EC:2.7.13.3]
Glycogen synthesis	K16150	K16150; glycogen synthase [EC:2.4.1.11]
Exopolysaccharide synthesis	K16566	exoY ; exopolysaccharide production protein ExoY
Exopolysaccharide synthesis	K16567	exoQ ; exopolysaccharide production protein ExoQ
Exopolysaccharide synthesis	K16568	exoZ ; exopolysaccharide production protein ExoZ
Sporulation (Actinobacteria)	K16947	SPR28; sporulation-regulated protein 28
Glycogen synthesis	K20812	glgA; glycogen synthase [EC:2.4.1.242]

547

548

549 Table A4. Chlorophyll concentrations and water content values in the biocrust at each sampling point
 550 and site.

Time	Chlorophyll concentration (mg chl _a / g soil)	Water content (%)	Total organic carbon (%)	Total nitrogen (%)	Polysaccharides
T[0]	7.7	1.9	4.2	0.1	63.6
T[0]	8.6	2.7	4.1	0.1	69.4
T[0]	6.8	2.3	4.2	0.1	64.2
T[R]	10.1	13.6	3.0	0.1	54.3
T[R]	16.1	16.9	3.9	0.1	224.5
T[R]	15.7	16.6	3.8	0.1	134.8
T[R]	12.7	16.3	4.0	0.1	111.4
T[R]	14.2	17.5	4.0	0.1	157.1
T[1]	10.5	5.3	3.3	0.1	121.6
T[1]	16.0	5.6	3.2	0.1	82.6
T[1]	16.9	7.1	4.0	0.1	145.5
T[1]	15.3	6.2	4.0	0.1	168.9
T[1]	14.2	6.8	3.9	0.1	199.6
T[2]	10.1	3.9	3.9	0.1	78.4

558

559

560 Table A7. P-values of the Dunn tests between time points on the relative abundance of the
561 actinobacterial and cyanobacterial orders. Bold numbers are significant (<0.05).

Comparison	Cyanobacteria	Actinobacteria
T[0] - T[1]	6.1E-10	8.2E-13
T[0] - T[2]	5.1E-08	2.5E-14
T[0] - T[3]	6.0E-10	6.9E-11
T[0] - T[R]	6.5E-10	6.5E-14
T[1] - T[3]	5.0E-01	2.3E-01
T[1] - T[2]	1.9E-01	2.9E-01
T[1] - T[R]	5.0E-01	3.5E-01
T[2] - T[R]	1.9E-01	4.4E-01
T[3] - T[R]	4.9E-01	1.3E-01
T[2] - T[3]	1.9E-01	9.9E-02

562

563 Table A8. Abundance (in copy number (CN)) of each time points within each group of gene.

Gene Group	Time points	Abundance
DNA conservation	T[0]	20590
	T[R]	91433
	T[1]	92496
	T[2]	78321
	T[3]	81983
DNA repair and degradation	T[0]	13579
	T[R]	66132
	T[1]	67048
	T[2]	55948
	T[3]	58457
Light energy or sensing	T[0]	85
	T[R]	43
	T[1]	59
	T[2]	64
	T[3]	17
Lithotrophs	T[0]	7554
	T[R]	37972
	T[1]	38632
	T[2]	31341
	T[3]	32758
Nitrogen	T[0]	10027
	T[R]	50708
	T[1]	58068
	T[2]	48225
	T[3]	45638
Organotrophs	T[0]	60007
	T[R]	108275
	T[1]	111044
	T[2]	88557
	T[3]	89148
Phototrophy	T[0]	50301
	T[R]	445432
	T[1]	425819
	T[2]	342188
	T[3]	407532
ROS-damage prevention	T[0]	26126
	T[R]	138367
	T[1]	143726
	T[2]	121507
	T[3]	126677
Sensing & motility	T[0]	31075
	T[R]	81947
	T[1]	92070
Sensing & motility	T[2]	90844

	T[3]	74436
Sporulation capsule & C-storage	T[0]	7302
	T[R]	48141
	T[1]	48944
	T[2]	38998
	T[3]	42341

564

565 Table A9. Chi-square values and p-values of the Dunn tests between time points done on the
 566 functional prediction results. Bold numbers are significant (< 0.05)

Comparison	DNA Conservation	DNA Repair	Light energy	Lithotrophy	Nitrogen
T[0] - T[1]	4.9E-03	2.9E-03	1.9E-01	3.1E-04	4.2E-17
T[0] - T[2]	2.0E-02	9.7E-03	4.5E-01	7.5E-03	8.1E-12
